CONSERVATION & WATER QUALITY MONITORING

This report contains hydrologic data within Los Angeles County for the period beginning October 1, 1972 and ending September 30, 1973. Also included are summaries of data at selected locations for all years of record. The data is presented in six sections.

1. Precipitation - summarizes precipitation data for over 400 locations and discusses weather modification activities within Los Angeles County.

2. Evaporation - lists all locations for which evaporation data is on file, and provides monthly evaporation amounts at 24 locations for all years of record.

3. Runoff - Lists all locations for which data is on file and presents daily and seasonal runoff amounts for 51 streamflow stations.

4. Dam Operation - lists mean daily inflow, outflow, water surface elevation, and storage amounts as well as a summary of annual events for 15 dams and reservoirs.

5. Erosion Control - presents debris histories for 80 debris basins and maps major watershed burns for the three-season period.

6. Groundwater and Conservation - presents groundwater maps for the 5 major groundwater basins and records of water conserved at various facilities.

Where practical, all data which would satisfy immediate needs and serve as a useful reference is published in these reports. Several tables appear listing locations for which unpublished data is available. Additional information may be obtained by writing to:

Mr. A. E. Bruington, Chief Engineer
Los Angeles County Flood Control District
P. O. Box 2418, Terminal Annex
Los Angeles, CA 90051

SUMMARY OF THE 1972–73 SEASON

RAINFALL

Average rainfall over Los Angeles County was 18.02 inches (115 per cent of normal). Rainfall amounts vary considerably throughout the County, ranging from 14 inches on the Coastal Plain, to 28 inches in the mountains and then dropping sharply to 8 inches in the desert. For the past season, these amounts were 17.16 inches (125 per cent normal), 32.64 inches (116 per cent normal), and 6.84 inches (87 per cent normal). Approximately 75 per cent of the rain fell in the two-month interval from mid January to mid March. The largest storm of the year occurred from February 10 through 14, with February 11 producing the largest single day rainfall.

Most snow fell during the February 10 through 14 storm. Crystal Lake, in the midst of the San Gabriel reservoir drainage area, reported 19 inches of snow on the ground on February 14. Big Pines Recreation Park reported 60 inches of snow on the ground on that same date.

RUNOFF

The average seasonal inflow to the District's reservoirs was 117 per cent of normal. Most peak flows throughout the County occurred on February 11, 1973. Peaks at streamflow recording stations did not exceed any past recorded events.

EVAPORATION

Evaporation for eight selected locations was 94 per cent of average.

FIRE

The largest fire occurred in the Rolling Hills area and burned approximately 900 acres.

EROSION

The average annual erosion rate into the District's debris basin was 5,300 cubic yards per square mile. The prior historical average was 5,000 cubic yards per square mile.

CONSERVATION

During the 1972-73 season, over 195,000 acre-feet of local water, 140,000 acre-feet of imported water, and 22,000 acre-feet or reclaimed water were used to replenish the ground-water basins from spreading facilities, injection facilities, reservoirs, and unlined channels.

GROUNDWATER LEVELS

Ground-water levels throughout most of the County either remained stable or increased due to the above normal rainfall and the large quantities of water conserved in spreading facilities.

SEAWATER BARRIER PROJECTS

The District operates three barrier projects to protect the ground water in the West Coast and Central Basins against sea-water intrusion by creating a freshwater pressure ridge at key locations along the coastline. These pressure ridges are created by injecting fresh water into the ground through a series of injection wells. During the period, 28,100 acre-feet of water were injected at the West Coast Basin Barrier Project, 5,200 acre-feet at the Dominguez Gap Barrier Project.

TOPOGRAPHY

The Los Angeles County Flood Control District includes an area of 2,760 square miles with boundary contiguous to the County boundary. The most northerly portion and channel islands are excluded. The District measures approximately 66 miles in east-west and 55 miles in north-south directions.

The terrain within the District can be classified in broad terms as being 39 per cent mountainous, 17 per cent coastal plain, and 44 per cent hills, valley, or desert. Relief of the terrain ranges from sea level to a maximum elevation of 10,000 feet. The coastal plain is generally of mild slope and contains relatively few depressions or natural ponding areas. The slopes of main river systems crossing the coastal plain, such as the San Gabriel River, Los Angeles River, and Ballona Creek, range from 4 to 14 feet per mile.

Topography in the mountainous area is generally rugged, with deep, V-shaped canyons separated by sharp dividing ridges. Steep-walled canyons with side slopes of 70 per cent or more are common. The average gradient of principal canyons in the San Gabriel Mountains ranges from 150 to 850 feet per mile. Mountain ranges are aligned in a general east-west direction, the major range being the San Gabriel Mountains. The majority of mountain ridges lie below Elevation 5,000, the total area above this level being approximately 210 square miles.

GEOLOGY – Soils

Igneous, sedimentary, and metamorphic rock groups are all represented within the District. The San Gabriel Mountains and Verdugo Hills are composed primarily of highly fractured igneous rock, with large areas of granitic rock formation being exposed above soils which are coarse and porous. Faulting and deep weathering have produced porous zones in the rock formation; however, rock masses have produced a comparatively shallow soil mantle due to the steepness of slopes which accelerates erosion of the fine material.

Other moutaineous and hilly reaches within the District are composed primarily of folded and faulted sedimentary rocks, including shale, sandstone, and conglomerate. Residual soils in these areas are shallow and are generally less previous than those of the San Gabriel mountain range.

Valley and desert soils are alluvial and vary from coarse sand and gravel near canyon mouths to silty clay and gravel or clay in lower valleys and coastal plain. The alluvial fill has been built up be repeated deposition of debris, in places to depths as great as 2,000 feet. This fill is quite porous in areas of relatively low clay content. Impervious lenses and irregularities in the underlying bedrock divide the alluvium into several distinct ground water basins. Valley soils are generally well drained and relatively few perched water or artesian areas are present.

LAND USE

The principal vegetative cover of upper mountain areas consist of various species of brush and shrubs knowns as chaparral. Most trees found on mountain slopes are oak, with alder, willow, and sycamore found along stream beds at lower elevations. Pine, cedar, and juniper are found in ravines at higher elevations and along high mountain summits.

The chaparral is extremely flammable; and extensive burns of the mountain vegetation frequently occur during dry, low-humidity weather accompanied by high winds. Chaparral has the ability to sprout following fires and grows rapidly to re-establish the watershed cover within a period of 5 to 10 years following a burn.

Grasses are the principal natural vegetation on the hills. Much of the hill land and nearly all of the valley land in the densely popu-

lated portion of the District south of the San Gabriel Mountains has been converted to urban and suburban use. Development of the Santa Clara River valley and desert areas to the north of the San Gabriel Mountains is sparse at present but is proceeding at an accelerated rate.

CLIMATE

The climate within the District varies between subtropical on the Pacific Ocean side of the San Gabriel mountain range to arid in the Mojave Desert. Mean seasonal precipitation ranges from 11 inches at the ocean to more than 45 inches at the crest of the mountains and to less than 5 inches in the desert. Nearly all precipitation occurs during the months of December through March. Precipitation during summer months is infrequent, and rainless periods of several months are common. Snowfall at elevations above 5,000 feet is frequently experienced during the winter storms, but the snow melts rapidly except on higher peaks and the northern slopes. Snow is rarely experienced on the coastal plain.

January and July are the coldest and warmest months of the year, respectively. At Los Angeles, the 30-year average daily minimum temperature for January is 46.6 degrees above zero and the average daily maximum temperature for July is 83.3 degrees. At Mount Wilson (elevation 5,850 feet), the 25-year average daily minimum temperature for January is 34.5 degrees above zero and the average daily maximum temperature for July is 80.2 degrees.

HYDROMETEOROLOGIC CHARACTERISTICS

Coastal and Mountain Areas

Precipitation in the Los Angeles area occurs primarily in the form of winter orographic rainfall associated with extratropical cyclones of North Pacific origin. Major storms consist of one or more frontal systems and occasionally last four days or longer. Air masses and frontal systems associated with major storms commonly extend for 500 to 1,000 miles in length and produce rainfall simultaneously throughout the District. Major storms approach Southern California from the west or southwest with southerly winds which continue until frontal passage. The mountain ranges lie directly across the path of the inflow of warm, moist air; and orographic effects cause precipitation to be greatly intensified.

The effect of snowmelt upon flood runoff is of significance in the few cases when warm spring rains from southerly storms fall on a snowpack. During major storms, temperatures throughout the District may remain above freezing.

Average individual storm rainfall amounts and intensities conform to a fairly definite areal pattern which reflects general effects of topographic differences.

Desert Areas

Summer convective rainfall is principally experienced in the upper San Gabriel Mountains and the Mojave Desert regions. In many desert areas, the most serious flooding occurs as a result of summer convective storms.

RUNOFF CHARACTERISTICS

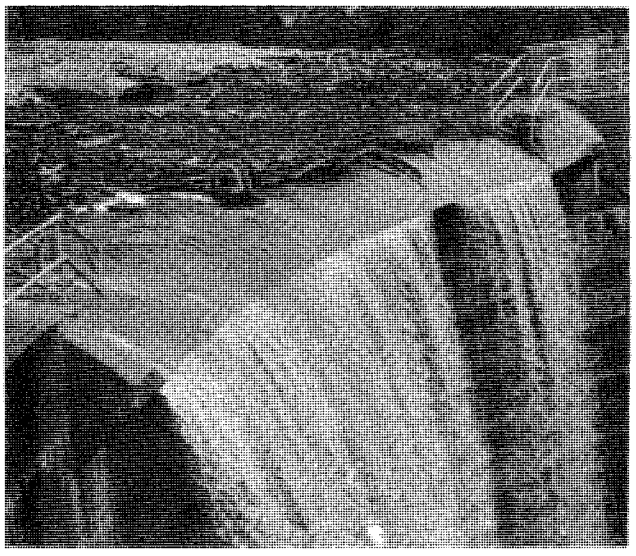
Mountain Areas

In mountain areas, the steep canyon slopes and channel gradients are conducive to rapid concentration of storm runoff quantities. Depression storage and detention storage effects are minor in the rugged terrain. Soil moisture during a storm has a pronounced effect on runoff from the porous soils supporting a good growth of deep-rooted vegetation such as chaparral. Soil moisture deficiency is greatest at the beginning of a rainy season, having been depleted by evapotranspiration process during the dry summer months. Precipitation during periods periods of soil moisture deficiency absorbed by soils; and except for periods of extremely intense rainfall, significant runoff does not occur until soils are wetted to field moisture capacity. Due to high infiltration rates and porosity of mountain soils, runoff occurs primarily as subsurfaceflow or interflow rather than as direct runoff. Spring or base flow is essentially limited to portions of the San Gabriel mountain range, most streams in the District being intermittent.

Runoff from a mountain watershed recently denuded by fire exceeds that for the unburned state due to greatly increased quantities of inorganic debris present in the flow and increased direct runoff resulting from lowered infiltration rates. Large amounts and sizes of debris have been transported by flood flows from a denuded watershed. Debris production from a major storm has amounted to as much as 120,000 cubic yards per square mile of watershed. Boulders up to eight feet in diameter have been deposited in a valley area a considerable distance from their source. Debris quantities equal in volume to storm runoff, or in other words 100 per cent bulking of runoff from a major storm, have been recorded. Where debris-laden flow traverses an alluvial fill unconfined by flood control works, flood discharges follow an unpredictable path across the debris cone formed at the canyon mouth.

Hill and Valley Areas

In hill areas, runoff concentrates rapidly from the generally steep slopes; however,



runoff rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size. In those hill areas which have been developed for residential use, concentration times become considerably decreased due to drainage improvements, and runoff volumes and rates become increased due to increased imperviousness. On the other hand, erosion is controlled and debris content of storm flow is practically eliminated. Debris production rates from undeveloped hill areas are normally smaller than those from mountain areas of the same size.

In highly developed valley areas, local runoff volumes have increased as the soil surface has become covered by impervious materials. Peak runoff rates for valley areas have also increased due to elimination of natural ponding areas and improved hydraulic efficiency of water carriers such as streets and storm drain systems.

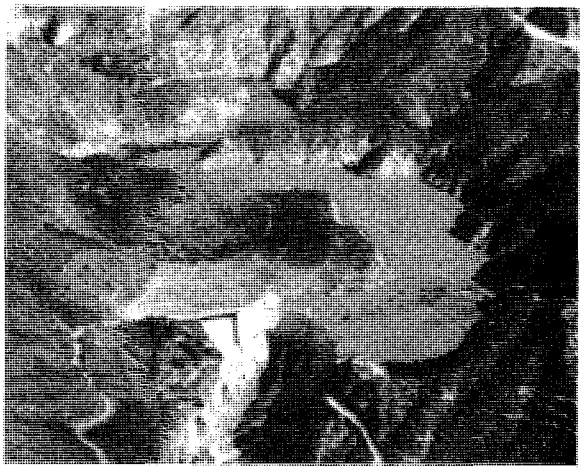
THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

FLOODS . . . AN OLD STORY

Floods in Los Angeles County have been recorded as far back as the days of the Mission Padres. For centuries waters have swept out of the San Gabriel Mountains causing extensive property damage and taking a great toll of lives.

Such a flood occurred in 1914 causing over $10 million in property damage and taking many lives. As a result, the State legislature passed an act creating the Los Angeles County Flood Control District.

The District was assigned two tasks... control the floods and conserve the water.



CONTROLLING THE WATERS

Successful early bond issues financed construction of the 14 dams which the District built high in the San Gabriel Mountains to impound storm waters until they could be released in an orderly fashion. Debris basins were constructed to trap eroded materials which had caused terrible damage in the past. Flood channel improvements were undertaken to confine the waters.

District engineers prepared a Comprehensive Plan in the early 1930's which provided for the control of flooding and the saving of as much of the water as praticable. With minor modifications, it is still the plan today.

Federal legislation in 1936 brought the Army Corps of Engineers into the local flood control picture. Since that time, the two agencies have been jointly prosecuting construction of the Comprehensive Plan which is now nearing completion. The District also cooperates with the United States Soil Conservation Service and the Forestry Service in erosion control and debris reduction programs.

CONSERVING THE WATERS

In addition to its flood control program, the District has the equally important task of conserving as much of the storm and other waste waters as practicable. The use of spreading grounds adjacent to river channels and their tributaries permits water to be percolated into underground reservoirs for later pumping by consumers. These spreading grounds are composed of porous sands and gravels and look somewhat like rice paddies.

Importance of this activity is apparent when it is realized that over 40 per cent of the water used in the County is pumped from underground supplies. The growth of the County combined with a prolonged drought has seriously depleted these supplies in recent years.

Other major conservation efforts by the District include combatting the serious intrusion by salt water of fresh well supplies along the Pacific Ocean, studies concerning the feasibility of using reclaimed sewage waters in spreading operations, and applied research to determine the effectiveness of cloud seeding to provide additional waters for percolation.

ORGANIZED TO DO THE JOB

Day to day administration of District affairs is vested in the Chief Engineer who is appointed by and responsible to the Board of Supervisors. The dual mission of the agency is recognized in its organization. Although a large part of the District's activities involve the construction of flood control and water conservation facilities, the operation and maintenance of dams, debris basins, spreading grounds, channels and storm drains are also of great importance.

Some 1,500 civil service employees serve the District and through it the general public, in a variety of tasks. Most have storm assignments which place them on call 24 hours a day throughtout the winter season.

PRECIPITATION

This report contains basic precipitation data collected by the District for the water year beginning October 1, 1972, and ending September 30, 1973. In addition, the District maintains less extensive records of other climatological data such as temperature, barometric pressure, humidity, and wind direction and velocity.

RAINFALL

The daily and monthly rainfall data shown herein are based on the standard gage readings. At stations equipped with both standard and recording rain gages, the standard gage amounts are proportioned to the chart amounts at the designated time of reading. Storm total amounts caught by storage-type gages are proportioned to nearby stations for daily and monthly figures. Generally, the District uses a 5 p.m. time of reading, but recognizes other times of readings at stations where the observer is not available at 5 p. m. Daylight Saving Time was observed for the October 1, 1972, to October 29, 1972, periods to April 29, 1973, to October 28, 1973.

WEATHER MODIFICATION

As part of its water conservation efforts in the Los Angeles area, the Districxt has conducted weather modification activities since the 1961-62 season. This project is intended to increase rainfall only in certain predetermined "target" areas within the drainage basins upstream of Pacoima, Big Tujunga, and San Gabriel Dams. This increased rainfall results in additional runoff which is collected at these reservoirs and is later released to various spreading facilities downstream to replenish the ground water supply.

The District uses four ground-based seeding devices situated at various locations within the County. Both intermittent and continuous seeding equipment is employed. Continuous seeding is accomplished by vaporizing a silver iodide-acetone solution and injecting it into a propane flame. The flame both crystalizes the silver iodide and provides the connection required to lift the crystals into the cloud masses where they act a nuclei. The intermittent seeding is a refinement of this technique. Rather than injecting small amounts of silver iodide into the atmosphere continuously throughout a storm, solid state flare-like devices are burned for brief 8-minute periods, emitting larger amounts of silver iodide into the concentrated rain bands which pass over the target area periodically.

Throughout the program's history it has generally been evident that the artificial nucleation devices have significantly increased rainfall in the target areas and have contributed to the District's water conservation program. Analysis of data show that the increase in rainfall over the target areas for the history of the program has averaged approximately 10 to 15 per cent.

SNOW SURVEYS

District personnel measure snow depths and densities at 12 locations periodically within the San Gabriel Mountains. The snow pack data presented herein are based on annual snow surveys conducted on or about April 1 of each year. The snow courses range in elevation from 5,800 feet to 8,500 feet and lie within the San Antonio, San Gabriel, Little Rock, and Big Rock drainage areas.

COOPERATION

The cooperation of observers in furnishing data to this District as a public service is appreciated. The efforts of the many agencies and individuals who have so freely cooperated with us in the collection of these data have resulted in the large number of complete records for the season covered bv this report.

DEER FLATS SNOW COURSE

LOCATION

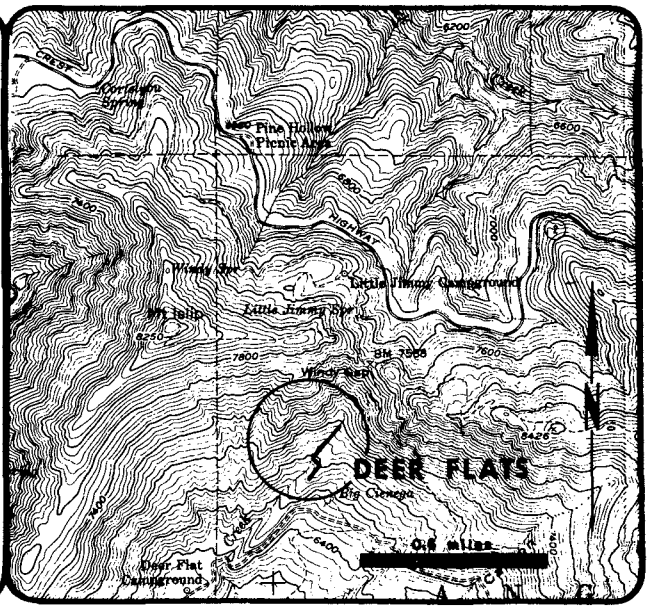
2 miles northeast of Crystal Lake Ranger Station
San Gabriel Mountains
southern exposure

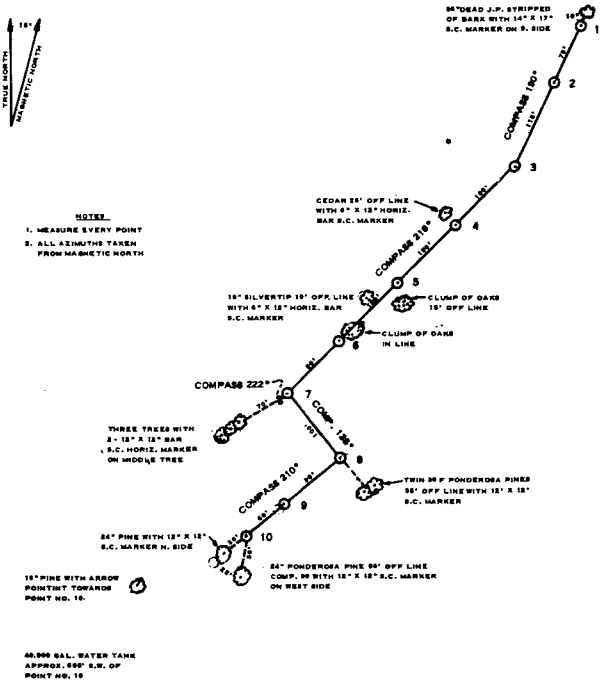
ELEVATION
6800'

LENGTH OF COURSE
880'

DRAINAGE AREA
San Gabriel River

PERIOD OF RECORD
1963 to date





SUMMARY OF ANNUAL SNOW SURVEY DATA - DEER FLATS

SEASON	AVERAGE SNOW DEPTH (IN INCHES)	AVERAGE WATER CONTENT (IN INCHES)	DENSITY (PERCENT)
1962-63	0	0	
1963-64	10.6	4.9	46
1964-65	31.3	8.5	27
1965-66	0	0	
1966-67	12.9	4.1	32
1967-68	0	0	
1968-69	13.9	6.0	43
1969-70	0	0	
1970-71	0	0	
1971-72	0	0	
1972-73	43.2	20.0	48

EVAPORATION

Data for 24 active evaporation stations were reported to the District during the season. Daily records of active and inactive District stations, as well as some stations of other agencies, are available in the District's files. Monthly and seasonal evaporation has been published in the District's Annual or Biennial Reports on Hydrologic Data since the 1931-32 season. Evaporation is normally measured at 5 p.m. to be consistent with rainfall measurements.

SUMMARY OF EVAPORATION

The following tabulation indicates the maximum and minimum rates of evaporation in inches at stations within the County for the season. For comparative purposes, only the evaporation amounts from a 24-inch diameter land evaporation pan equipped with a screen were used.

1972-73

Maximum Seasonal Amount -	Big Tujunga Reservoir.....		74.23"
Maximum Monthly Amount -	Palmdale.....	July	13.20"
Minimum Seasonal Amount -	Big Dalton Dam.....	March	40.17"
Minimum Monthly Amount -	Baldwin Park Experimentaal Station.....	January	0.78"

COOPERATION

The District Receives evaporation data from the Los Angeles City Department of Water and Power, The Metropolitan Water District, the Southern California Edison Company, the United States Forest Service, County Departments, and various individuals.

LENGTH OF RECORD

The first land pan installed by this District was at Santa Anita Dam in March of 1929. There are 30 evaporation stations which have records of 15 seasons or more in the District's files.

EQUIPMENT

The District recognizes the evaporation values collected from the screened land pan, Type L-24S, as standard. A coefficient of equipment in the Lake Elsinore and Fullerton studies. No corrections have been made to the published data.

1. Land pan, Type L-24

   Twenty-four inches in diameter by 36 inches deep. Installed in ground 33 inches. Water in pan maintained near ground level.

2. Land pan, Type L-24S

   Same as L-24 above, except that it is equipped with a one-fourth-inch mesh hardware cloth that rests one and one-half inches below top of pan.

3. Land pan, Type L-48A

   Forty-eight inches in diameter by 10 inches deep. Installed with water surface approximately 14 inches above ground level. Water surface in pan maintained at two to three inches below top of pan.

4. Land pan, Type L-72

   Seventy-two inches in diameter by 36 inches deep. Installed in the ground 33 inches. Water in pan maintained near ground level.

5. Land pan, Type L-36

   Thirty-six inches square by 18 inches deep. In stalled in the ground 15 inches. Water in pan maintained near ground level.

6. Floating pan, Type F-36

   Thirty-six inches square by 18 inches deep. Mounted on float with the pan submerged to 15-inch depth. Water in pan maintained near lake level.

The District operated 99 water-stage recording stations during the season. Data from 44 District stations are summarized and published in this volume. An alphabetical list of all past and present streamflow stations is also included.

Also included herein are data from two stations operated by the United States Geological Survey and three by the Metropolitan Water District. The latter show the monthly quantities of imported water delivered for spreading under several cooperative agreements.

A map showing the location of all gaging stations currently operated by the District plus those which are the responsibility of the United States Geological Survey, the United States Corps of Engineers, and the Metropolitan Water District is included herein.

RECORDS OF STREAMFLOW RECORDING STATIONS

Records from recording stations are, in general, published under each station heading in three sections, giving the following information:

1. Station descriptions which present location drainage areas, channels, controls, regulations, diversions, and available records.
2. Daily discharge tabulations which show the mean daily runoff in second-feet and total monthly and yearly runoff in acre-feet.
3. Summary of total flows, and extremes of discharge for all years of record.

COOPERATION

The District receives streamflow data from other agencies and publishes, or has access to the records for local stations. District hydrographers also make periodic streamflow measurements and observations at installations belonging to these organizations. Data from 25 of the District stations are reviewed and published annually in the Geological Survey's annual water supply papers.

Agencies with which the District exchanges data area:

United States Geological Survey, Water Resources Division

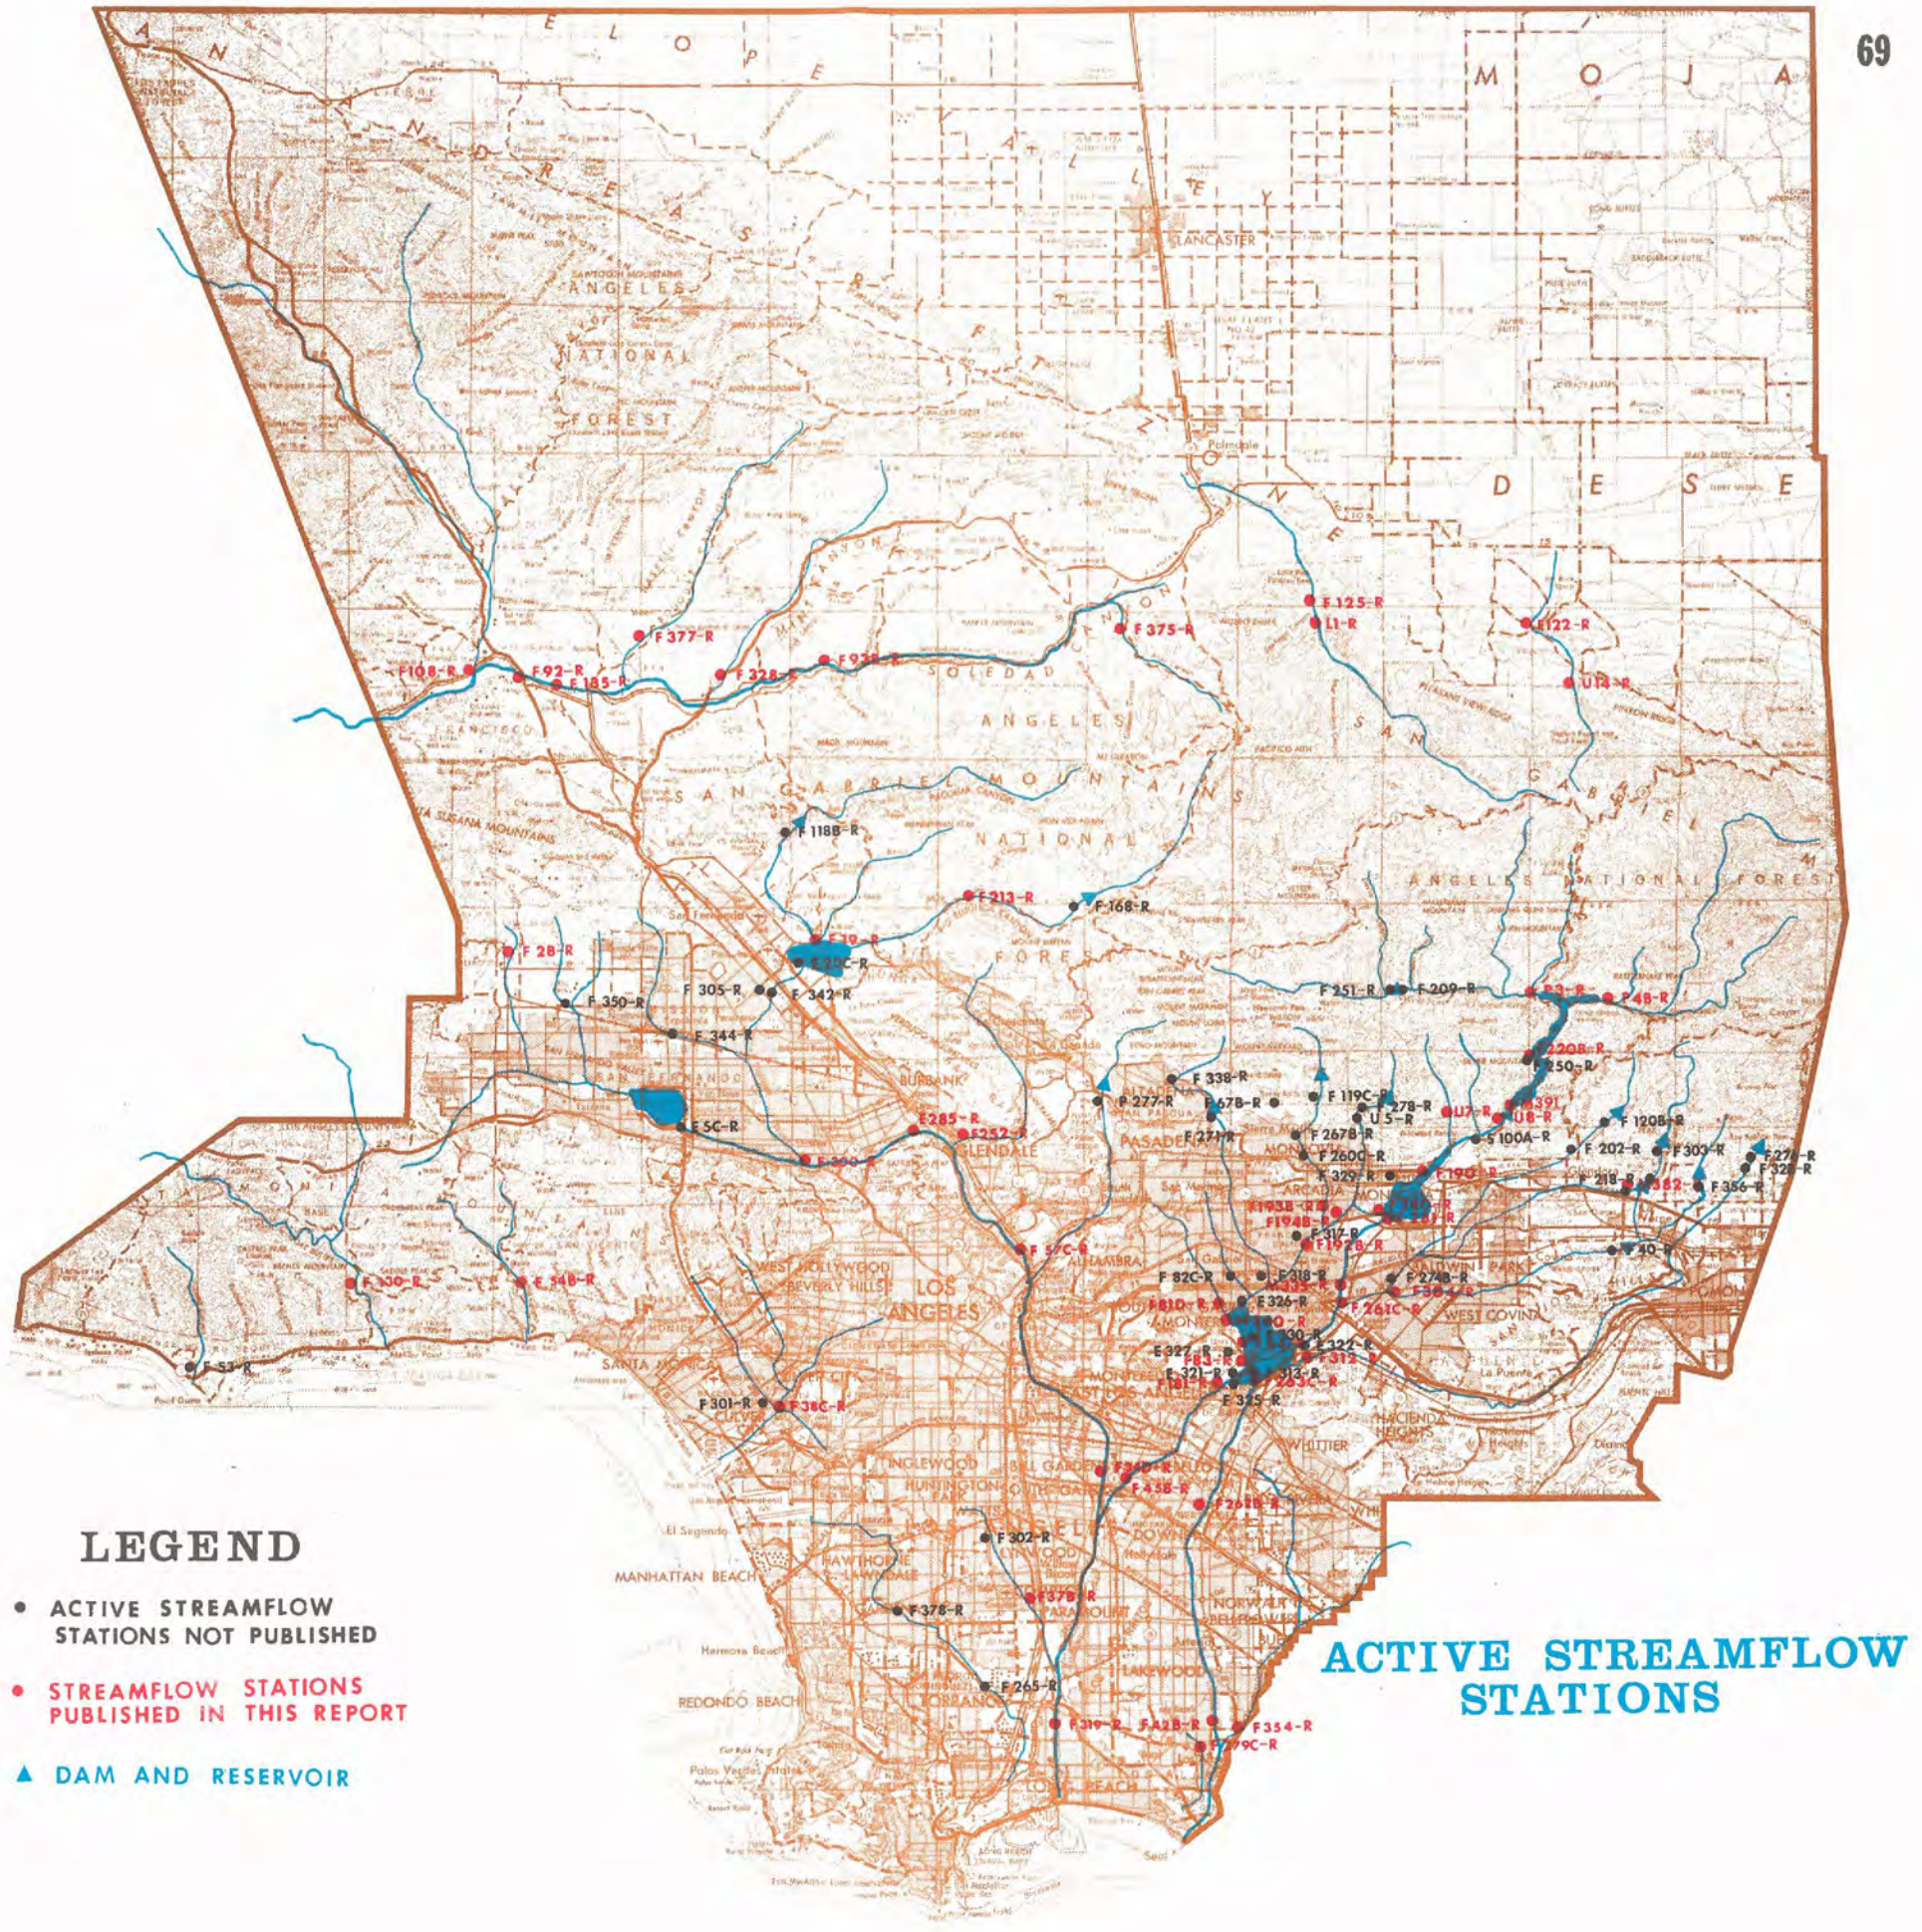
United States Corps of Engineers

The Metropolitan Water District

San Gabriel River Water Committee

LEGEND

Stations are designated by letters and num-



LEGEND

- ACTIVE STREAMFLOW STATIONS NOT PUBLISHED
- STREAMFLOW STATIONS PUBLISHED IN THIS REPORT
- ▲ DAM AND RESERVOIR

ACTIVE STREAMFLOW STATIONS

bers which indicate ownership, operating agency, and type of station. The letters used have the following connotations:

Prefix F - indicates stations owned and operated by the Los Angeles County Flood Control District.

Prefix B - indicates a station owned by the San Bernardino County Flood Control and operatd by the Los Angeles County Flood Control District.

Prefix E - indicates station owned and operated by the Corps of Engineers, Department of the Army.

Prefix U - indicates stations owned and operated by the United States Geological Survey, Water Resources Division. However, Stations U8-R and U7-R have been operated by the District since October 1, 1966, and October 1, 1971, respectively.

Prefix P - indicates stations owned and operated by the District, formerly operated by the Pasadena Water Department.

Prefix L - indicates station owned and operated by the District, formerly operated in cooperation with the Little Rock-Palmdale Irrigation District.

Prefix M - indicates station owned and operated by the Metropolitan Water District.

Prefix S - indicates station owned and operated by the San Gabriel River Water Committee.

Prefix V - indicates station owned and operated by the Ventura County Water Resources Division.

Suffix R - indicates a recorder station.

Suffix S - indicates a staff gage station.

Suffix B - indicates that the station has been moved. B represents second location, C a third location, etc.

The following legend is used for indicating estimates on the daily discharge data sheets:

"a" - No gage height record due to recorder or clock failure.

"b" - No gage height record due to obstructed communication or sanded well.

"c" - Gage height record affected by backwater.

"d" - Gage height record doubtful.

"e" - Other types of estimates.

"f" - Gage height record partly estimated. (Estimated part represents less than 75 per cent of the flow; otherwise, a, b, c, or d is used.)

"v" - Gage height-discharge relation failed due to extreme and undetermined shift or unusual drawdown in stilling well.

These letters are placed in the discharge column; letters are not used if the estimated portion of the record represents less than ten per cent of the mean daily flow or if the total flow is estimated at .05 cfs or less.

LIST OF STREAMFLOW RECORDS AVAILABLE

ALPHABETICAL LIST OF STREAMFLOW RECORDING AND MEASURING STATIONS FOR WHICH RECORDS ARE AVAILABLE AT THE LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

THE PERIOD OF RECORD INDICATES THE EARLIEST AND LATEST DATES FOR WHICH RECORDS ARE AVAILABLE.

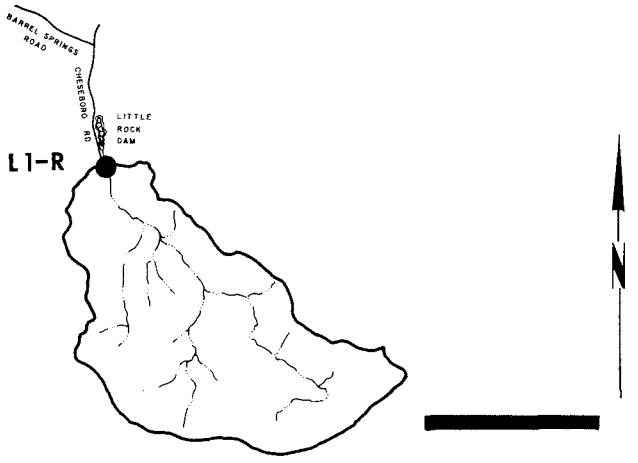
STATION NO. L 1 - R
LITTLE ROCK CREEK
above Little Rock Dam

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 49.2 square miles

LOCATION – 2.0 miles above Little Rock Dam, 5.0 miles south of Little Rock

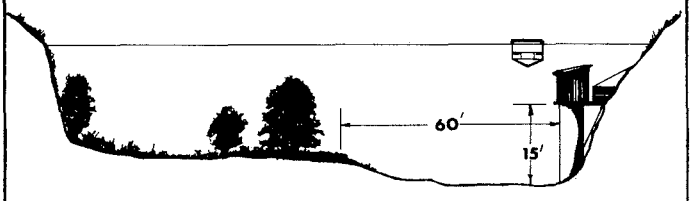
REGULATION – none

CHANNEL – sand, gravel, and boulders, natural in section

CONTROL – channel forms control

LENGTH OF RECORD – October 1, 1930, to date

cross-section



LOS ANGELES COUNTY
FLOOD CONTROL DISTRICT
HYDRAULIC DIVISION

STATION NO L1-R

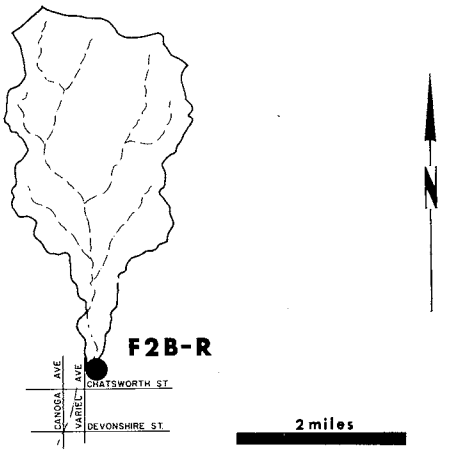
STATION NO. F 2B-R
BROWNS CREEK
at Variel Avenue

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 13.5 square miles

LOCATION – 100.0 feet upstream from Variel Avenue, 1.0 mile northeast of Chatsworth

REGULATION – none

CHANNEL – sand and gravel with pipe and wire revetments, temporarily improved section

CONTROL – concrete stabilizer

LENGTH OF RECORD –
at Station F2-R, December 11, 1928, to August 27, 1932
October 2, 1935, to October 31, 1939
at Station F2B-R, October 12, 1961, to date

SAN GABRIEL RIVER
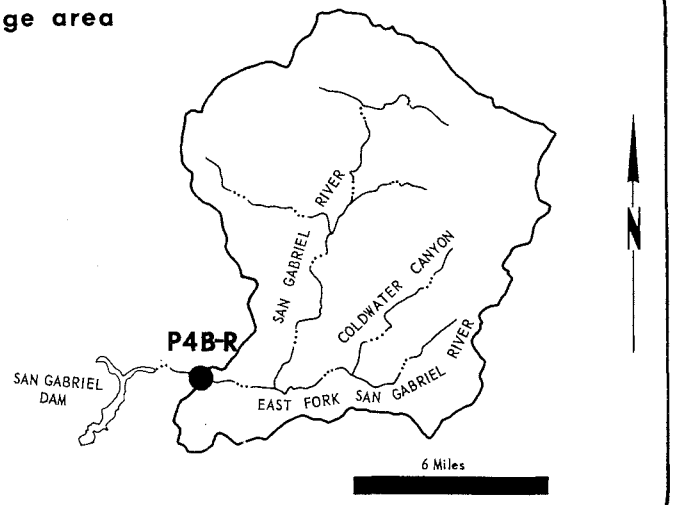
East Fork above Forks

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 88.2 square miles

LOCATION – 2.5 miles above the West Fork, 12.0 miles north of Azuso

REGULATION – none

CHANNEL – sand, gravels, and boulders, natural section

CONTROL – concrete, stabilizer with a 20-foot-wide low flow notch (constructed in November 1947)

LENGTH OF RECORD –
at Station P4-R, November 30, 1932, to December 10, 1938
at Station P4B-R, December 10, 1938, to date

REMARKS – the control height was increased 2.0 feet in September, 1955.

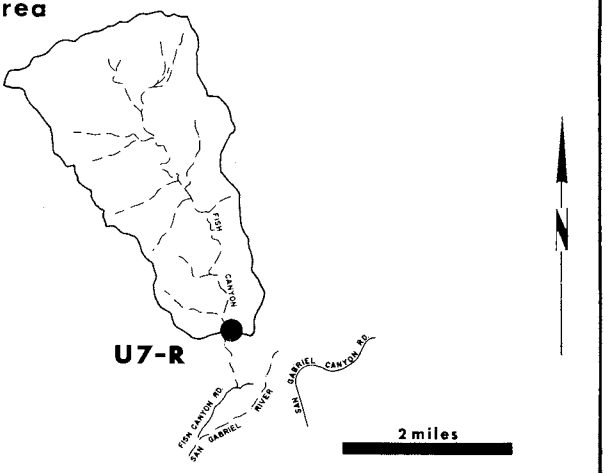
STATION NO. U 7 - R
FISH CREEK
above Mouth of Canyon

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 6.36 square miles

LOCATION – 0.8 miles upstream of mouth of canyon and 3.0 miles northeast of Duarte

REGULATION – none

CHANNEL – natural, rock and gravel

CONTROL – concrete control

LENGTH OF RECORD – July to September 1916
July 1917 to date

REMARKS – operated and maintained by USGS until October 1, 1971; records for 1969-70 and 1970-71 seasons were furnished by USGS

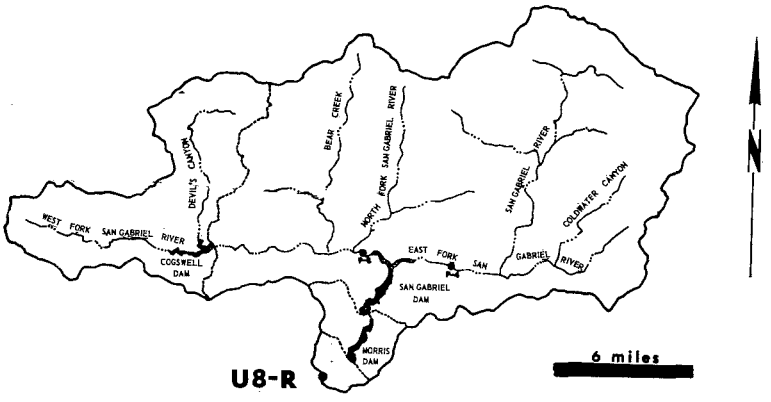
STATION NO. U 8-R
SAN GABRIEL RIVER
below Morris Dam

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 212.4 square miles

LOCATION – 1.1 miles downstream of Morris Dam, 2.7 miles northeast of Azusa

REGULATION – all flows regulated by Cogswell, San Gabriel, and Morris Dams

CHANNEL – gravel and boulders, natural section

CONTROL – channel forms control

LENGTH OF RECORD – May 1894 to date

REMARKS – flows up to 90 cfs are at times diverted past the station through the Azusa Conduit; flows at station may include imported water from the MWD outlet below Morris Dam

cross-section

Additional information

Releases of imported water are made occasionally from The Metropolitan Water District outlet, USG 3, below Morris Dam. These releases flow past the Gaging Station U8-R and are included in the record of that station. During the 1971-72 season a release of 2915.5 acre-feet was made in February. Releases in the 1972-73 season were 6667 acre-feet in November and 436 acre-feet in December.

Average discharge of local water for a 78-year period is 153 second-feet (adjusted for regulations and diversions).

Normal unregulated flow adjusted for storage in reservoirs, evaporation, and diversion to the Azusa Conduit.

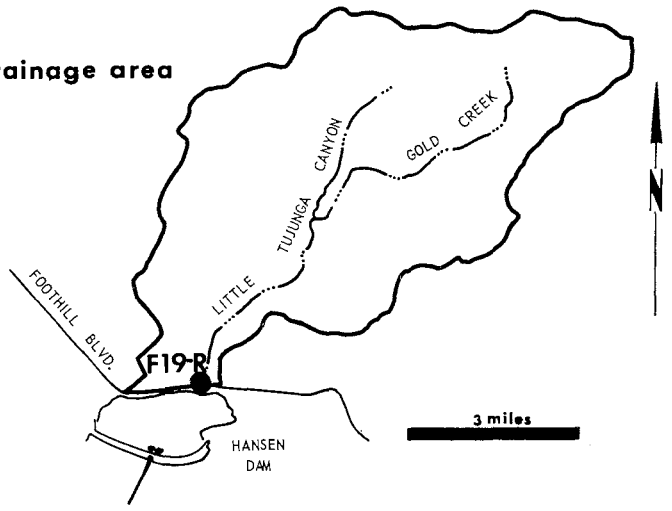
N.D. = NOT DETERMINED
* = RECORD INCOMPLETE

STATION NO. F 19 - R
LITTLE TUJUNGA WASH
at Foothill Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 21.0 square miles

LOCATION – at Foothill Boulevard bridge, 4.0 miles easterly of San Fernando

REGULATION – none

CHANNEL – sand and silt, natural in section

CONTROL – concrete wall below gage

LENGTH OF RECORD – December 26, 1928, to date

cross-section

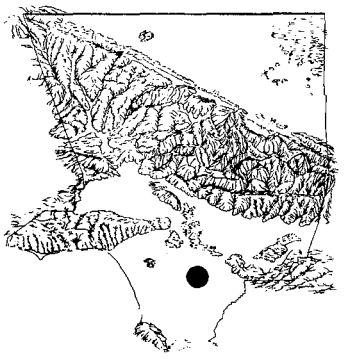
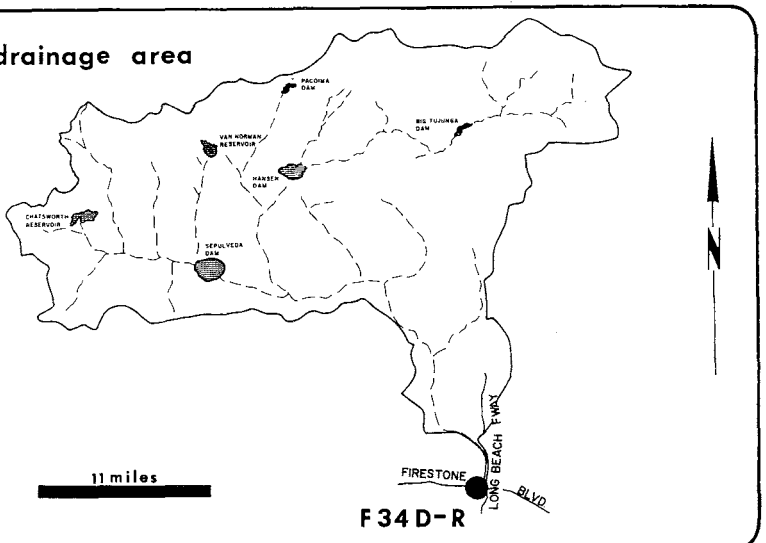
STATION NO. F34D-R
LOS ANGELES RIVER
below Firestone Boulevard



drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 596.0 square miles

LOCATION – 472.0 feet downstream of Firestone Boulevard 3.0 miles west of Downey

REGULATION – partially regulated by Sepulveda, Pacoima, Big Tujunga, Hansen, and Devil's Gate Dams; and by several spreading grounds, reservoirs, and debris basins.

CHANNEL – concrete, with rip-rap side slopes, trapezoidal in section, with trapezoidal low-flow channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F34-R, March 1, 1928 to April 11, 1938
at Station F34B-R, April 11, 1938, to November 3, 1949
at Station F34C-R, November 4, 1949, to December 11, 1956
at Station F34D-R, December 11, 1956 to date

REMARKS – subject to diversions from Big Tujunga Creek, Arroyo Seco, and other domestic and irrigation diversions

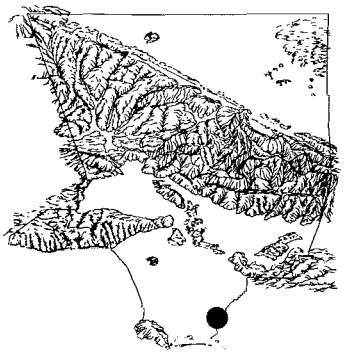
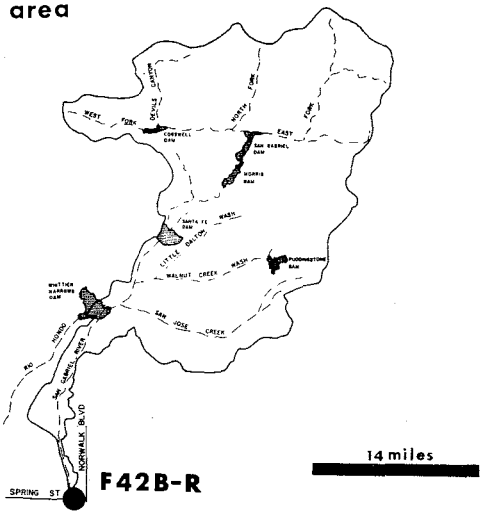
B = RECORD BEGAN AT B LOCATION 05-14-36.
C = RECORD BEGAN AT C LOCATION 08-10-67.
N.D. = NOT DETERMINED

STATION NO. F 42B-R
SAN GABRIEL RIVER
above Spring Street



drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 231.0 square miles (excludes area above Santa Fe Dam)

LOCATION – 455.0 feet north of Spring Street, 4.0 miles east of Signal Hill, Long Beach

REGULATION – partially regulated by Cogswell, San Gabriel, Morris, Santa Fe, Big Dalton, San Dimas, Puddingstone Diversion, Puddingstone, Live Oak, Thompson Creek, and Whittier Narrows Dams, several debris basins, MWD outlet, and several spreading grounds.

CHANNEL – concrete, trapezoidal section with a low-flow channel.

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F42-R, February 6, 1928, to May 26, 1964
at Station F42B-R, November 16, 1964, to date

REMARKS – high flows into Whittier Narrows Reservoir are partially diverted to the Rio Hondo

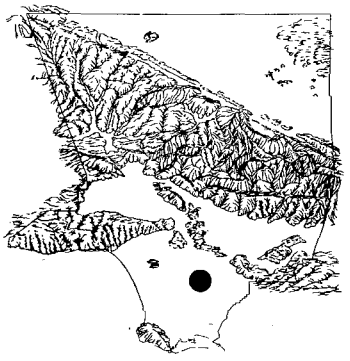
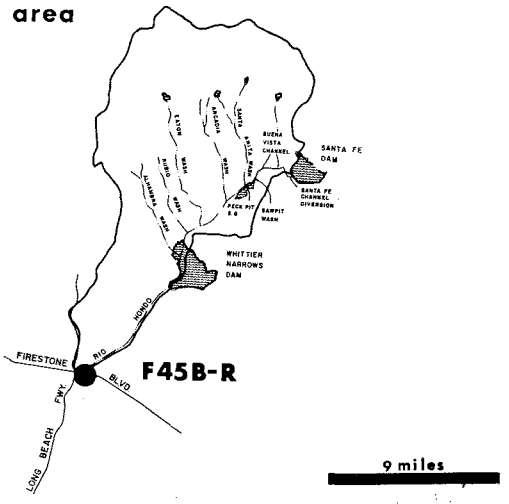
STATION NO. F 45B-R
RIO HONDO
above Stewart and Gray Road



drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 140 square miles (excludes area above Santa Fe Dam)

LOCATION – 0.6 mile upstream of the confluence of Rio Hondo and Los Angeles River, 1.5 miles west of Downey

REGULATION – partially regulated by Sierra Madre, Santa Anita, Sawpit, Eaton, Santa Fe, and Whittier Narrows Dams, several debris basins, and spreading grounds

CHANNEL – concrete, with rip-rap side slopes. trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F45-R, March 1, 1928, to April 18, 1951
at Station F45B-R, October 31, 1951 to date

REMARKS – subject to diversions from Eaton Creek, Monrovia Creek, Sawpit Creek, Little Santa Anita Canyon and other

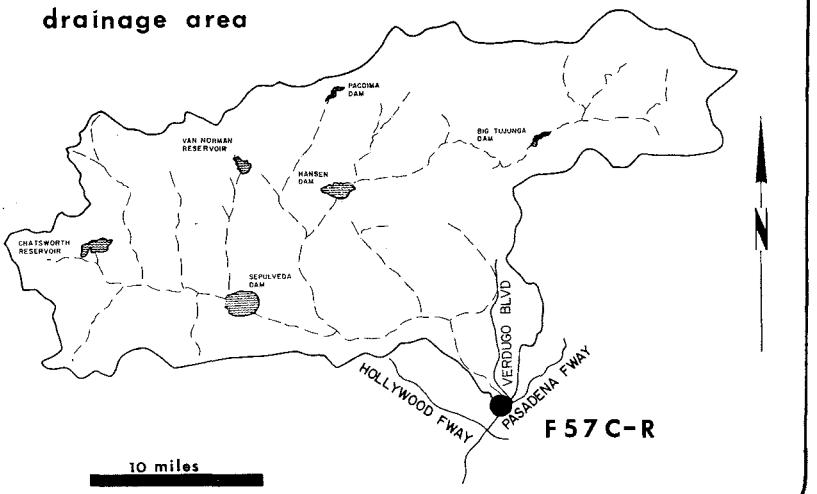
STATION NO. F 57C-R
LOS ANGELES RIVER
above Arroyo Seco

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 511 square miles

LOCATION – 800.0 feet above the confluence of the Arroyo Seco with the Los Angeles River, Los Angeles

REGULATION – partially regulated by Sepulveda, Pacoima, Big Tujunga, and Hansen Dams; and by several spreading grounds, reservoirs, and debris basins.

CHANNEL – concrete, rectangular in section, with a trapezoidal low-flow channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F57-R, December 5, 1929, to May 26, 1938
at Station F57B-R, April 5, 1939, to December 8, 1939
at Station F57C-R, December 8, 1939, to date

REMARKS – subject to diversions from Big Tujunga Creek, and other diversions for domestic and irrigation uses

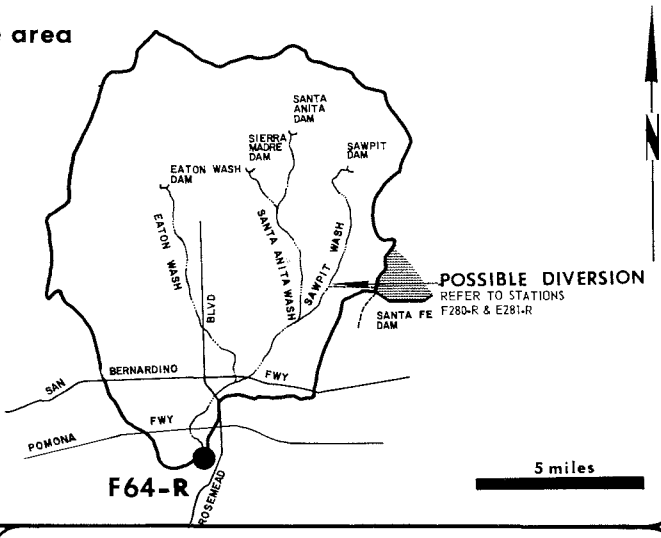
STATION NO. F 64-R
RIO HONDO
above Mission Bridge

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 115 square miles (excludes area above Santa Fe Dam)

LOCATION – 1,000 feet above San Gabriel Boulevard, west of Rosemead Boulevard, 2.0 miles northeast of Montebello

REGULATION – partially regulated by Sierra Madre, Santa Anita, Sawpit, Eaton, and Santa Fe Dams and several debris basins.

CHANNEL – sand and silt, natural in section

CONTROL – none

LENGTH OF RECORD – July 1, 1928 to date

REMARKS – subject to diversions; water purchased from the MWD passes this station for spreading in the coastal basin

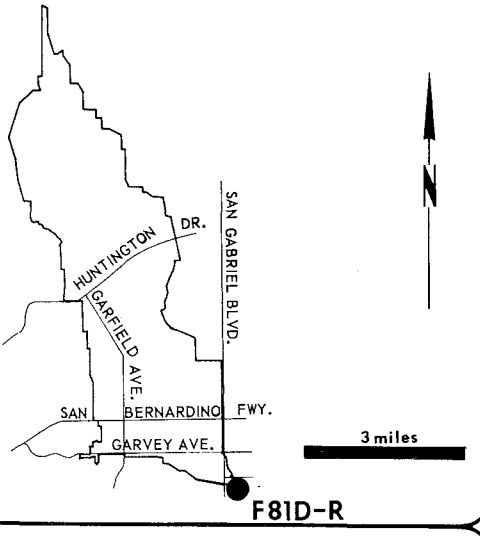
E = ESTIMATE

STATION NO. F 81D-R
ALHAMBRA WASH
near Klingerman Street

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from footbridge

DRAINAGE AREA – 15.2 square miles

LOCATION – 250± feet above Klingerman Street and 2,650.0 feet below Garvey Avenue, South San Gabriel

REGULATION – none

CHANNEL – concrete, rectangular in section, 40.0 feet wide by 12.7 feet deep

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F81-R, January 14, 1930 to September 30, 1934
at Station F81B-R, October 1, 1934, to February 25, 1935
at Station F81C-R, February 25, 1935, to April 27, 1936
at Station F81B-R, April 27, 1936, to May 22, 1936
at Station F81D-R, September 2, 1936, to date

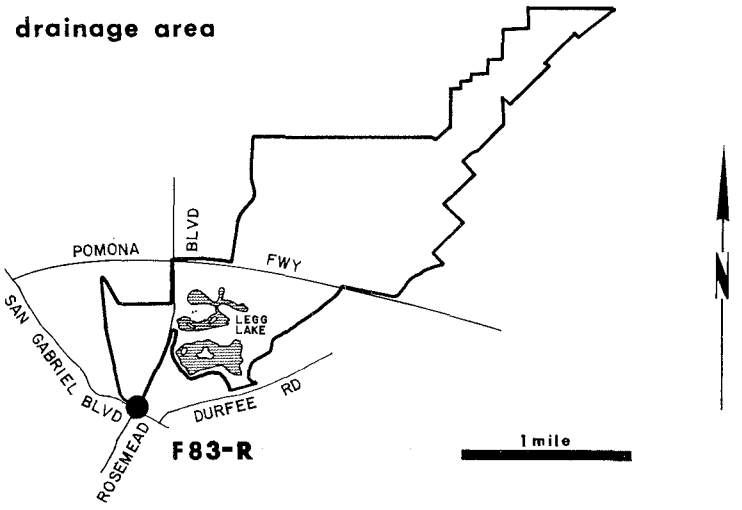
STATION NO. F 83-R
MISSION CREEK
at San Gabriel Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 4.2 square miles

LOCATION – upstream of San Gabriel Boulevard, 0.2 miles northeast of Montebello

REGULATION – partially regulated by outflow from Legg Lake

CHANNEL – sand with brush and fences, natural in section

CONTROL – channel forms control

LENGTH OF RECORD – June 14, 1930, to date

REMARKS – nearly all flows originate in rising water

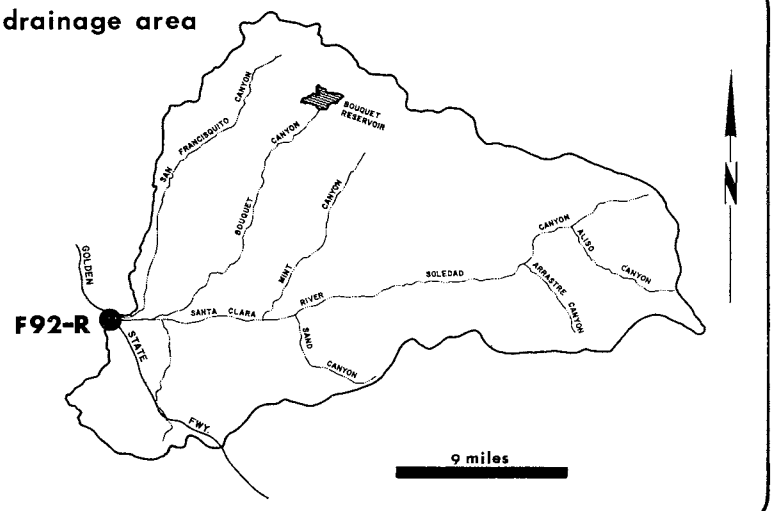
STATION NO. F 92 - R
SANTA CLARA RIVER
below Highway 5

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA - 410.4 square miles

LOCATION - downstream side of Old Highway bridge, 3.0 miles west of Saugus

REGULATION - partially regulated by Bouquet Canyon and Dry Canyon Reservoirs

CHANNEL - sand and gravel with brush, natural section

CONTROL - none

LENGTH OF RECORD -
at Station F92-R, January 18, 1930 to March 28, 1938
September 24, 1956 to date
at Station F92B-R, October 1, 1938 to September 24, 1956

REMARKS - subject to diversions for irrigation

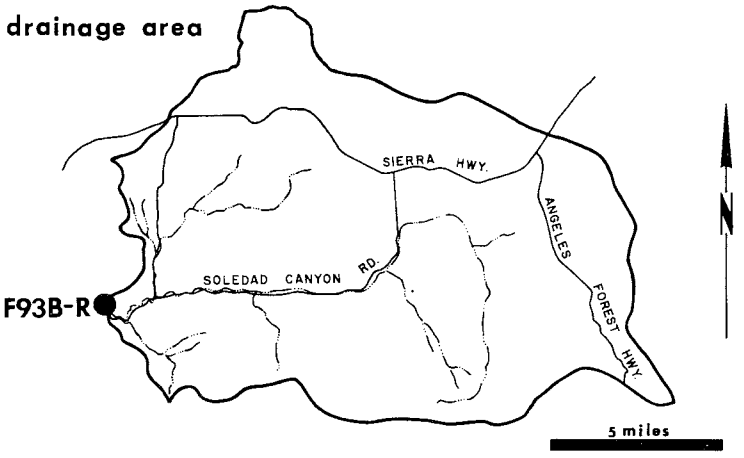
STATION NO. F 93B-R
SANTA CLARA RIVER above Lang Station at R.R. Bridge

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 157.3 square miles

LOCATION – 0.7 mile above Lang Railroad Station, at railroad bridge, 15.0 miles northeast of Newhall

REGULATION – none

CHANNEL – sand, gravel, and rock, natural section

CONTROL – none

LENGTH OF RECORD – April 3, 1970, to date

REMARKS – Station F93-R, located 0.25 mile below Station F93B-R, is maintained for high flows. It has daily records available for the Seasons 1949-1968, as shown in the summary.

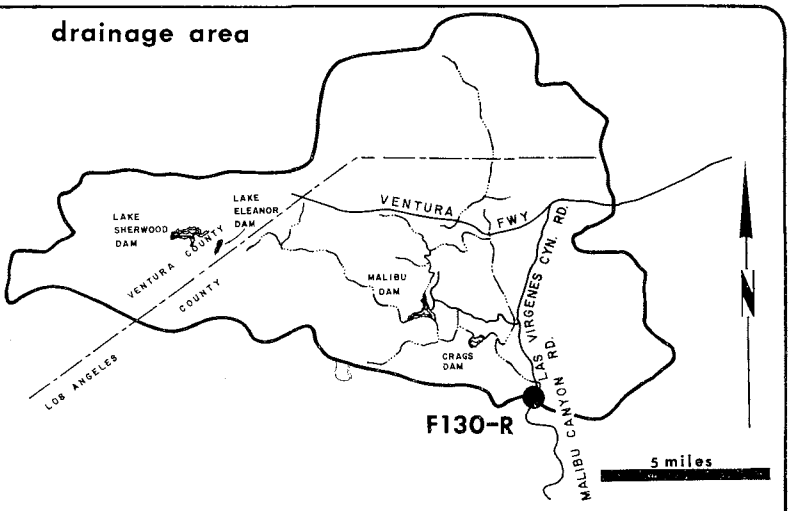
STATION NO. F 130 - R
MALIBU CREEK
below Cold Creek

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from coble car

DRAINAGE AREA – 103.0 square miles

LOCATION – 0.2± mile downstream of Cold Creek, 6.0 miles southwest of Calabasas

REGULATION – Lake Sherwood Dam, Lake Eleanor Dam, Malibu Lake Dam, and Craq's Dam. Other small recreational dams affect low summer flows.

CHANNEL – coarse sand and gravel, lined with trees and brush, natural in section

CONTROL – concrete stabilizer

LENGTH OF RECORD – January 17, 1931, to date

REMARKS – cableway washed out on January 25, 1969; no high flow measurements since that date

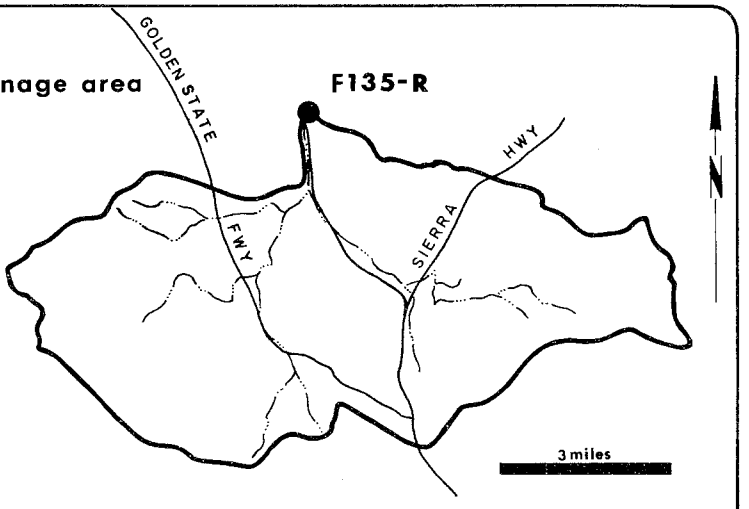
STATION NO. F 135-R
SANTA CLARA RIVER-SO.FORK
at Magic Mountain Parkway

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 40.9 square miles

LOCATION – upstream side of Magic Mountain Parkway 800.0 feet west of San Fernando Road, Saugus

REGULATION – none

CHANNEL – natural, sand, and gravel

CONTROL – grouted rubble control under railroad bridge

LENGTH OF RECORD – September 9, 1947 to date

REMARKS – for measurements prior to September 9, 1947, see Station F135-S

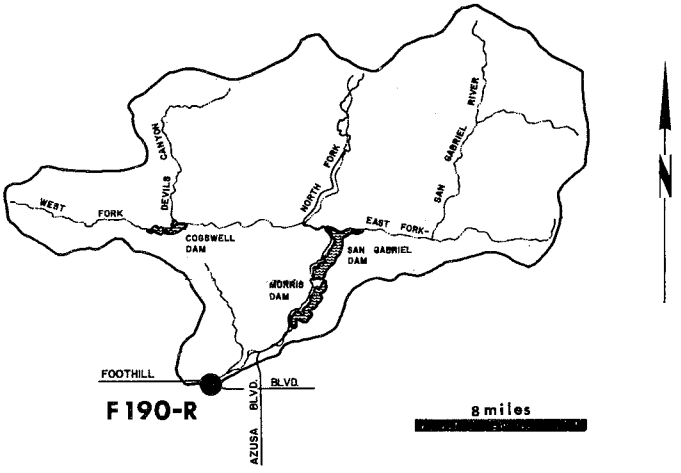
STATION NO. F 190 - R
SAN GABRIEL RIVER
at Foothill Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 230.0 square miles

LOCATION – downstream side of Foothill Boulevard bridge, 2.0 miles west of Azusa

REGULATION – partially regulated by Cogswell, San Gabriel, and Morris Dams

CHANNEL – sand, gravel and rock, trapezoidal section with soft bottom

CONTROL – gunited rock stabilizers

LENGTH OF RECORD – February 22, 1932, to date

REMARKS - flows may include imported water originating at the Metropolitan Water District outlet below Morris Dam.

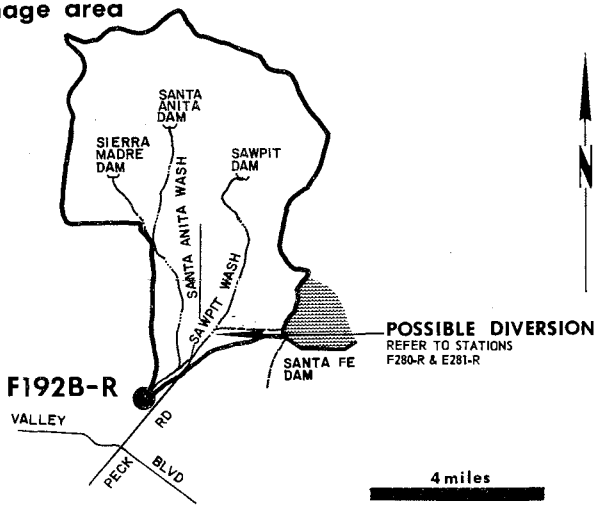
STATION NO. F 192B - R
RIO HONDO
below Lower Azusa Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 40.9 square miles (excludes area above Santa Fe Dam)

LOCATION – 300.0 feet downstream from Lower Azusa Road, 1.5 miles north of El Monte

REGULATION – partially regulated by Sierra Madre Dam, Santa Anita Dam, Sawpit Dam, Santa Fe Dam, Peck Pit, Buena Vista Pit, and several debris basins.

CHANNEL – concrete, trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F192-R, February 22, 1932, to May 7, 1958
at Station F192B-R, May 7, 1958, to date

REMARKS – subject to diversions from Monrovia, Sawpit, and Little Santa Anita Creeks. Also from the San Gabriel River below Santa Fe Dam; and for irrigation and spreading.

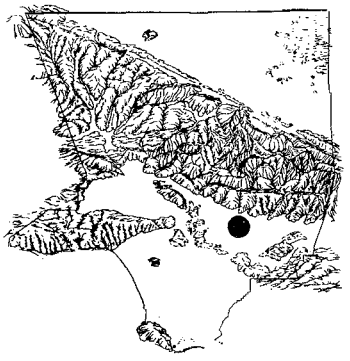
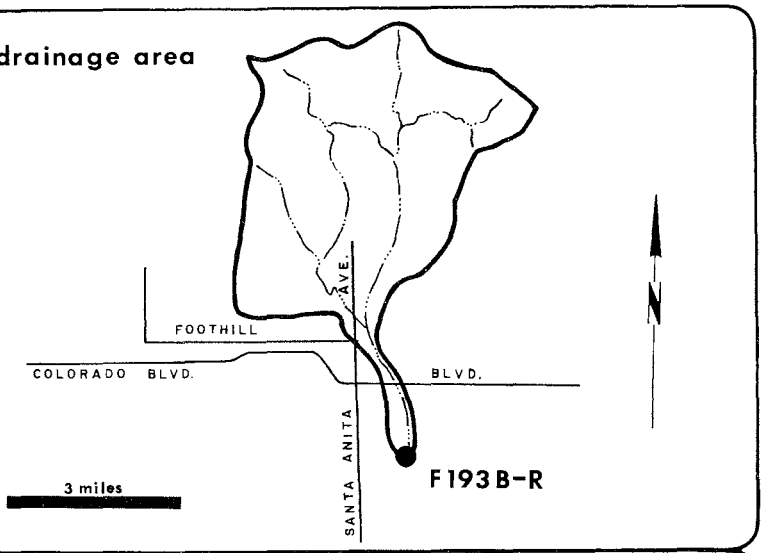
B = RECORD BEGAN AT B LOCATION 12-18-58.

STATION NO. F 193 B-R
SANTA ANITA WASH
at Longden Avenue



drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 18.8 square miles

LOCATION – 30.0 feet above Longden Avenue, 1.5 miles south of Arcadia

REGULATION – regulated by Santa Anita and Sierra Madre Dams, and Santa Anita Debris Basin

CHANNEL – concrete, rectangular section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F193-R, April 25, 1932, to March 1, 1938
at Station F193B-R, January 5, 1960, to date

cross-section

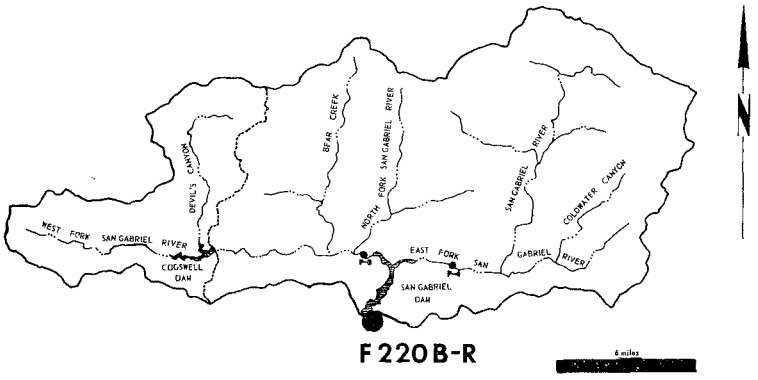
STATION NO. F 220B-R
SAN GABRIEL-AZUSA CONDUIT
at 10 ft. Weir below San Gab. Dam

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - weir formula with gage height observation

DRAINAGE AREA - none

LOCATION - on the concrete conduit which diverts from San Gabriel Dam, 160 feet below the dam

REGULATION - regulated by San Gabriel dam

CHANNEL - rectangular in section

CONTROL - 10-foot concrete weir

LENGTH - February 26, 1933, to date

REMARKS - approximate capacity 95 second-feet

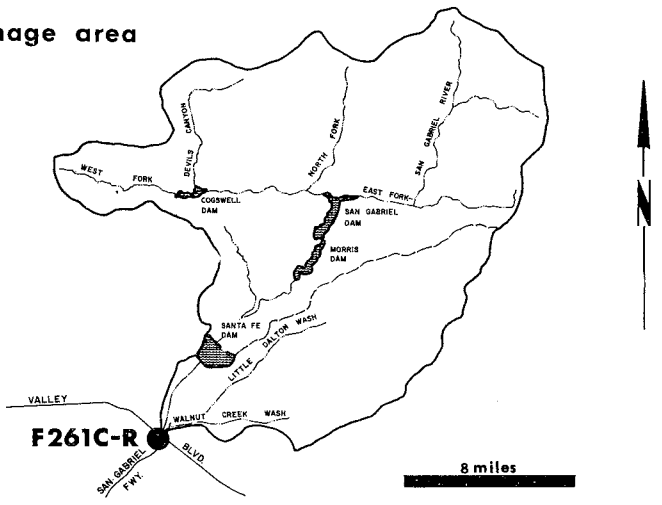
STATION NO. F 261C-R
SAN GABRIEL RIVER
below Valley Boulevard

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading

DRAINAGE AREA – 118.0 square miles (excludes area above Santa Fe Dam)

LOCATION – 1,150.0 feet below Valley Boulevard, 2.5 miles east of El Monte

REGULATION - partly regulated by Santa Fe, Big Dalton, Puddingstone Diversion, and Puddingstone Dams.

CHANNEL – sand and gravel bottom with rip-rap side slopes; trapezoidal section

CONTROL – concrete stabilizer with low-flow notch

LENGTH OF RECORD –
at Station F261-R, March 11, 1937, to September 30, 1941
at Station F261B-R, October 1, 1941, to April 23, 1946
at Station F261C-R, November 29, 1960, to date

REMARKS - flows may include imported water originating at Metropolitan Water District outlets at San Dimas

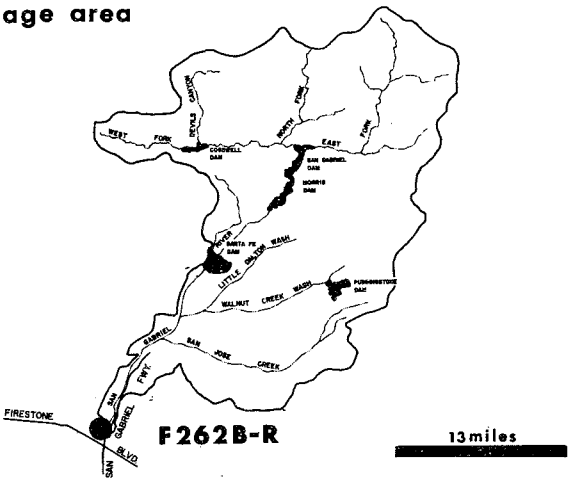
STATION NO. F 262B-R
SAN GABRIEL RIVER
above Florence Avenue

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS - wading or from cable car

DRAINAGE AREA – 215.8 square miles (excludes area above Santa Fe Dam)

LOCATION – 1,400 feet above Florence Avenue, 2.0 miles east of Downey

REGULATION – partially regulated by Cogswell, San Gabriel, Morris, Santa Fe, Big Dalton, San Dimas, Puddingstone Diversion, Puddingstone, Live Oak, Thompson Creek and Whittier Narrows Dams, several debris basins, MWD outlets, and several spreading grounds

CHANNEL – sand bottom with rip-rap side slopes, trapezoidal section

CONTROL – concrete stabilizer

LENGTH OF RECORD –
at Station F267-R, February 27, 1937 to September 30, 1967
at Station F262B-R, August 6, 1968, to date

REMARKS – no record during 1967-1968 season due to channel construction

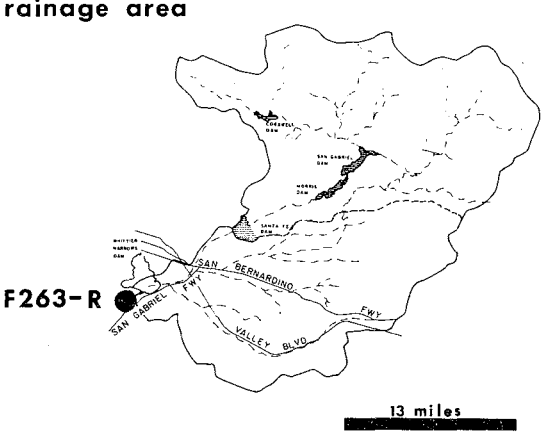
STATION NO. F 263C-R
SAN GABRIEL RIVER
below San Gabriel River Parkway

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 206.3 square miles (excludes area above Santa Fe Dam)

LOCATION – 462.0 feet below San Gabriel River Parkway, 1.4 miles northeast of Pico Rivera

REGULATION - partly regulated by Santa Fe, Big Dalton, Puddingstone Diversion, Puddingstone, and Thompson Creek Dams. Flows may include imported water from several Metropolitan Water District outlets. Water is at times diverted to the Zone I ditch upstream of Whittier Narrows Dam.

CHANNEL – rip-rap slopes with sand bottom trapezoidal section

CONTROL – concrete stabilizer

LENGTH OF RECORD –
at Station F263-R, February 4, 1937, to March 6, 1952
at Station F263B-R, March 6, 1952, to August 9, 1968
at Station F263C-R, August 9, 1968, to date

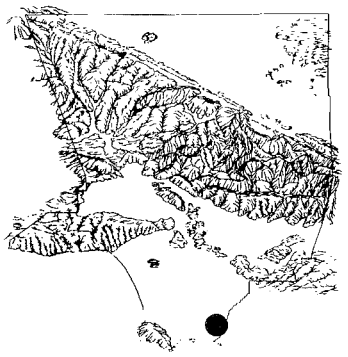
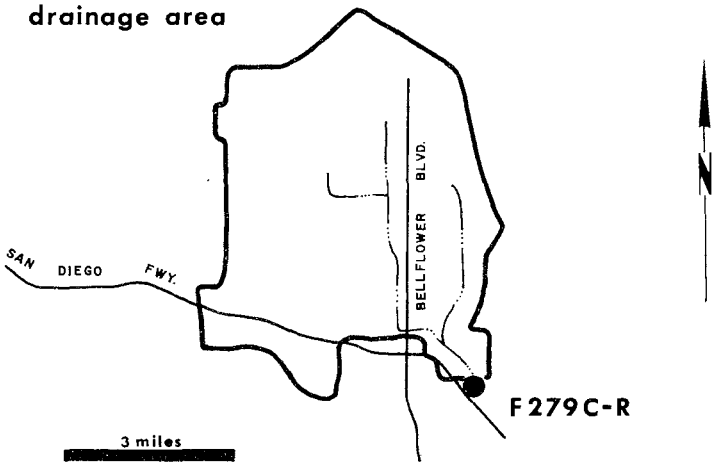
STATION NO. F 279C-R
LOS CERRITOS CHANNEL
at Stearns Street



drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from bridge

DRAINAGE AREA – 25.6 square miles

LOCATION – upstream of Stearns Street, Lang Beach

REGULATION – none

CHANNEL – concrete, trapezoidal in section

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F279-R, November 23, 1942, to January 1, 1949
at Station F279B-R, January 1, 1949, to May 26, 1955
at Station F279C-R, October 26, 1955, to date

REMARKS – station not in service May 26, 1955, to October 26, 1955, due to channel construction

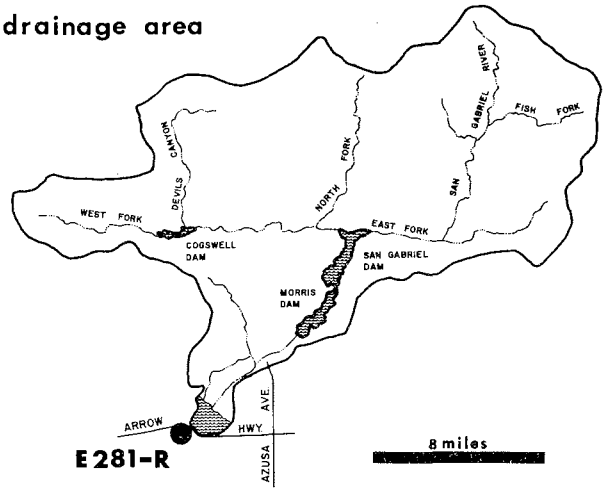
STATION NO. E 281 - R
SAN GABRIEL RIVER
below Santa Fe Dam

drainage area



RECORDER - continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 236.0 square miles (revised)

LOCATION – 1.7 miles north of Baldwin Park

REGULATION – regulated by Santa Fe Dam

CHANNEL – Stilling basin, located in the outlet channel immediately below Santa Fe Dam

CONTROL – 195.0-foot-wide concrete overflow section to the San Gabriel River and five gated openings to the Rio Hando diversion channel

LENGTH OF RECORD – February 9, 1943, to date

REMARKS - Station operated by USGS. Outflow from Santa Fe Dam may be diverted through Santa Fe Diversion Channel. Refer to Station 280.

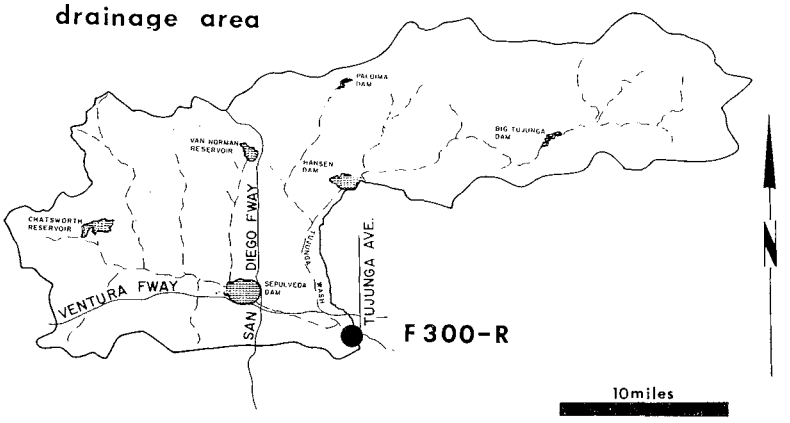
STATION NO. F 300 - R
LOS ANGELES RIVER
at Tujunga Avenue

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 401.0 square miles

LOCATION – 200.0 feet above Tujunga Avenue bridge Studio City

REGULATION – flow regulated by Sepulveda, Big Tujunga, Hansen, and Pacoima Dams, Lopez Debris Dam, and Project No. 85 Diversion

CHANNEL – concrete, rectangular section, 120 feet wide by 19 feet deep

CONTROL – channel forms control

LENGTH OF RECORD – May 8, 1950, to date

REMARKS – subject to diversions at mouth of Big Tujunga and Pacoima Canyons for irrigation, at Big Tujunga, Branford, Hansen, and Pacoima Spreading Grounds

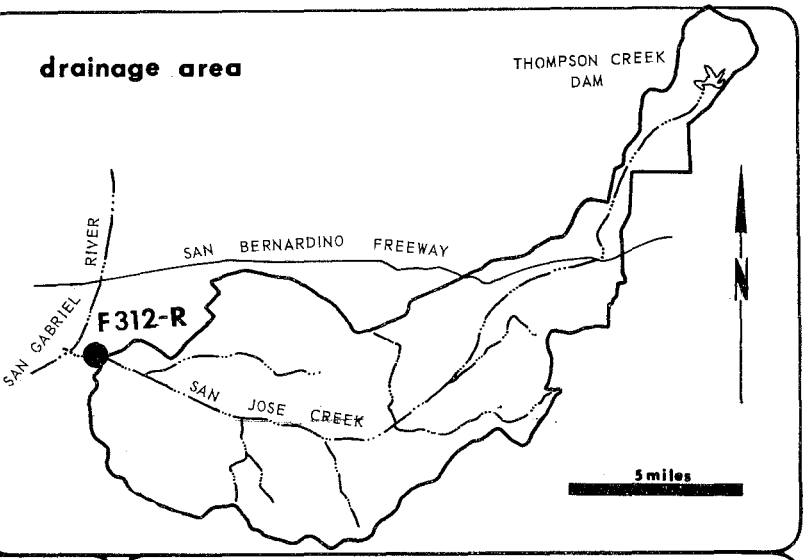
STATION NO. F 312 - R
SAN JOSE CHANNEL
above Workman Mill Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 83.4 square miles

LOCATION – 1,650 feet above Workman Mill Road, 3.0 miles southeast of El Monte

REGULATION – partially regulated by Thompson Creek Dam and Pomona Sewage Treatment Plant

CHANNEL – grouted rip-rap side slopes with natural bottom, trapezoidal section

CONTROL – rock stabilizer

LENGTH OF RECORD – September 13, 1955, to date

cross-section

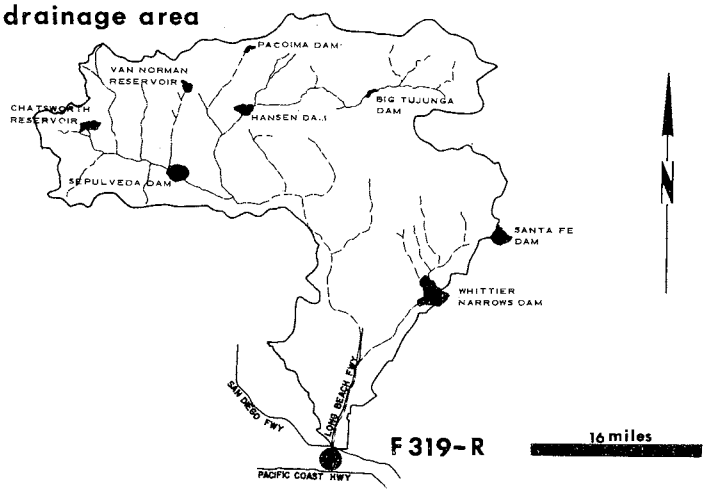
STATION NO. F 319-R
LOS ANGELES RIVER
below Wardlow Road

drainage area



RECORDER – continuous water stage

METHOD OF MEASUREMENTS – wading or from cable car

DRAINAGE AREA – 815.0 square miles (excludes area above Santa Fe Dam)

LOCATION – 900.0 feet below Wardlow Road, Long Beach

REGULATION – flow is subject to the same regulation as Stations F34D-R and P45B-R.
Diversion - flows diverted to Dominguez Gap Spreading Grounds

CHANNEL – trapezoidal, concrete, 302.0 feet wide at bottom with 2.25:1 side slopes. Low flow channel 28.0 feet wide by 1.0 foot deep in center of channel

CONTROL – channel forms control

LENGTH OF RECORD –
at Station F180-R, October 31, 1931, to January 13, 1956
at Station F319-R, January 13, 1956, to date

REMARKS – prior to 1931, see Station F36-R

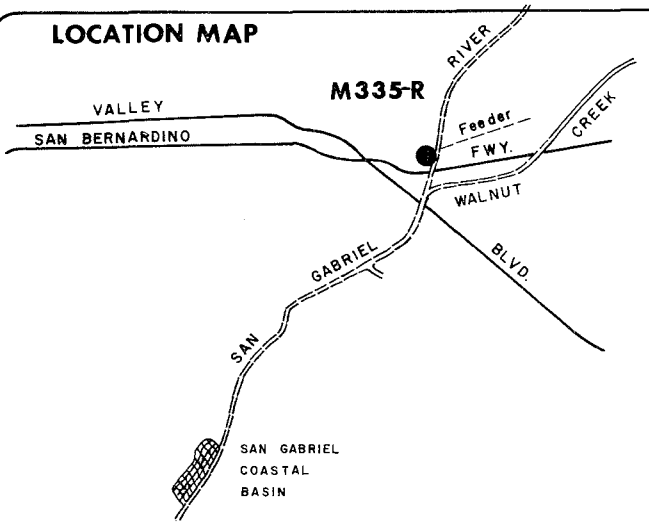
STATION NO. M335-R
SAN GABRIEL-MWD OUTLET BELOW RAMONA BOULEVARD

LOCATION MAP



LOCATION: Lat. 34°04'34", Long. 117°59'56" on outlet of The Metropolitan Water Department's middle feeder, near the left (east) bank of the river, about 400 feet south of Ramona Blvd. and 350 feet west of Rivergrade Road.

CHANNEL AND CONTROL: A 73-inch diameter orifice plate.

DISCHARGE MEASUREMENTS: All flows measured by orifice meter with totolizer beginning December 21, 1960.

RECORDER: A weekly Venturi recorder.

RECORDS AVAILABLE: At Station F 335-R, November 30, 1957 to April 13, 1960; at Station M335-R, December 17, 1960 to present.

OPERATION: Located, constructed and operated by The Metropolitan Water District in cooperation with the Los Angeles County Flood Control District. This station is operated solely for the purpose of measuring the delivery of Colorado River water by The Metropolitan Water District to the San Gabriel River.

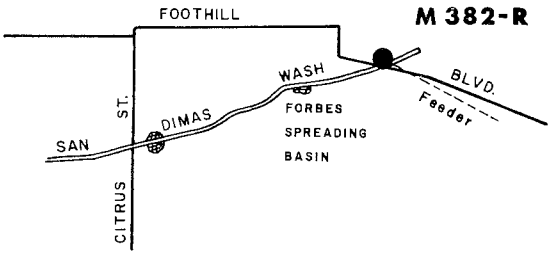
SAN DIMAS WASH-MWD OUTLET ABOVE FOOTHILL BOULEVARD

LOCATION MAP



LOCATION: Lat. 34°07'34", Long. 117°47'41", on the right, (west) bank at the inlet structure of the paved channel and about 1,250 feet above Foothill Boulevard; about 2 miles north of San Dimas. Elevation of outlet approximately 1,078.5 feet.

RECORDER: Continuous totalizing recorder with Venturi control.

REGULATION: Entirely regulated by gated outlet on The Metropolitan Water District upper feeder.

RECORDS AVAILABLE: October 29, 1968 to present.

OPERATION: Located, constructed, and operated by The Metropolitan Water District in cooperation with the Los Angeles County Flood Control District.

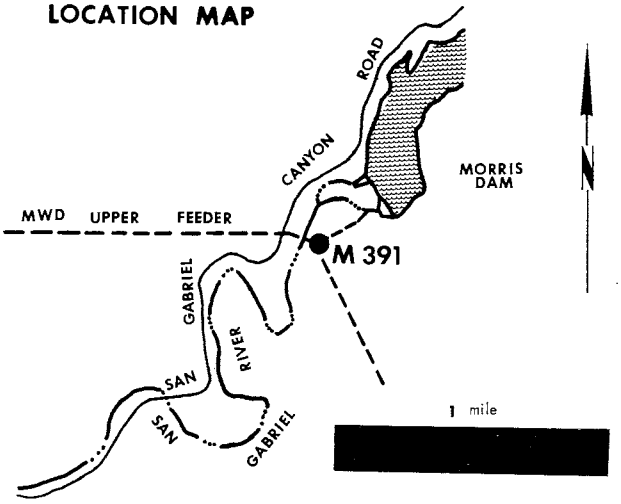
STATION NO. M391

SAN GABRIEL RIVER- MWD OUTLET BELOW MORRIS DAM

LOCATION MAP



LOCATION: Lat. 34° 10' 25", Long. 117° 53' 03", on the east bank of the San Gabriel River about 1400 feet below Morris Dam; about 3.5 miles northeast of Azusa. Elevation of outlet approximately 931 feet.

RECORDER: None. Data is computed by taking the difference between the recorded total flow at the La Verne pump plant and the record of releases at M382-R.

REGULATION: Entirely regulated by gated outlet on the Metropolitan Water District upper feeder.

RECORDS AVAILABLE: February 8, 1972 to present.

OPERATION: Located, constructed and operated by the Metropolitan Water District in cooperation with the Los Angeles County Flood Control District. This outlet is utilized for the delivery of Colorado River water to the San Gabriel River.

RISING WATER
at Whittier Narrows

The values of discharge summarized here are computed by means of interpolation between measured amounts. It has been necessary to estimate the quantity of rising water reaching Whittier Narrows during periods of high flow such as during storms. Beginning in 1954 the importation of Colorado River water for spreading created conditions which have made accurate measurements impossible to obtain. When these conditions prevail, estimates are made which are based on the nearest accurate values.

Rising water discharge is computed by the formula:

$$M = A + B - (C + D) + G + H - (I + J)$$

M = total rising water at Whittier Narrows.

A = computed flow of Mission Creek at San Gabriel Boulevard.

B = measured flow of Rio Hando at maximum rising water.

C = measured flow of Rio Hando above rising water, Station E326-R.

D = additional flow at various locations.

G = measured flow of San Gabriel River above Parkway Bridge, Station F86-S.

H = diversion above "G".

I = measured flow of San Gabriel River above rising water.

J = additional flow at various locations.

A graph has been included which shows the mean monthly rising water from January 1923 through the period of this report.

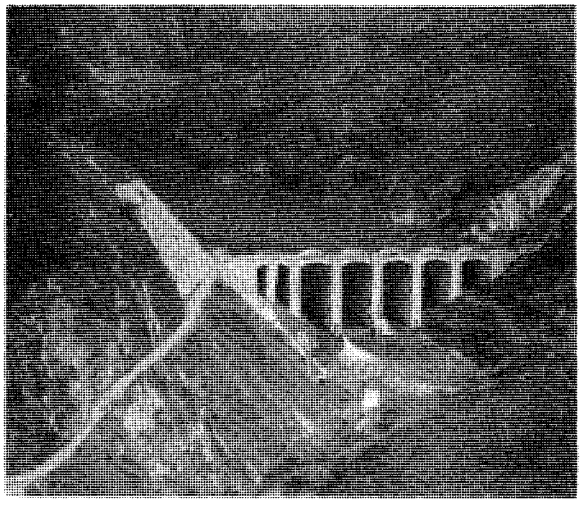
RESERVOIRS

FOREWORD

Following the damaging floods of 1913-14 and 1915-16, Los Angeles County initiated a program of flood control and water conservation including the construction of 14 dams. The first bond issue voted for flood control was in 1917. Devil's Gate, the first of the three dams built under this issue was completed in 1939. These dams were operaated by the District during the season covered by this report. In additon, five dams of the Los Angeles District, Corps of Engineers, Department of the Army, were utilized by the District to achieve flood control and water conservation The Corps of Engineers' dams are: Hansen Dam on Tujunga Wash, Sepulveda Dam on the Los Angeles River, Santa Fe Dam and Whittier Narrows Dam on the San Gabriel River and Rio Hondo, and San Antonio Dam on San Antonio Creek.

OPERATION

The reservoirs are operated to control floodwaters during storm periods. Post storm releases are made, when feasible, in amounts which can be conserved in spreading grounds and by natural channel percolation. Following the storm season, water is stored to provide stream flow during the dry summer months for recreation and water supply purposes.



RECORDS

The daily storage and flow records at fourteen of the District reservoirs are summarized on the Dam Operation Record Sheets. The sheets show:

1. Reservoir water surface elevations based on the spillway datum. Elevations are obtained from waterstage recorder graphs or interpolation from staff gage readings and recorded as of midnight of each day.

2. Storage in acre-feet based on the most recent topographic surveys.

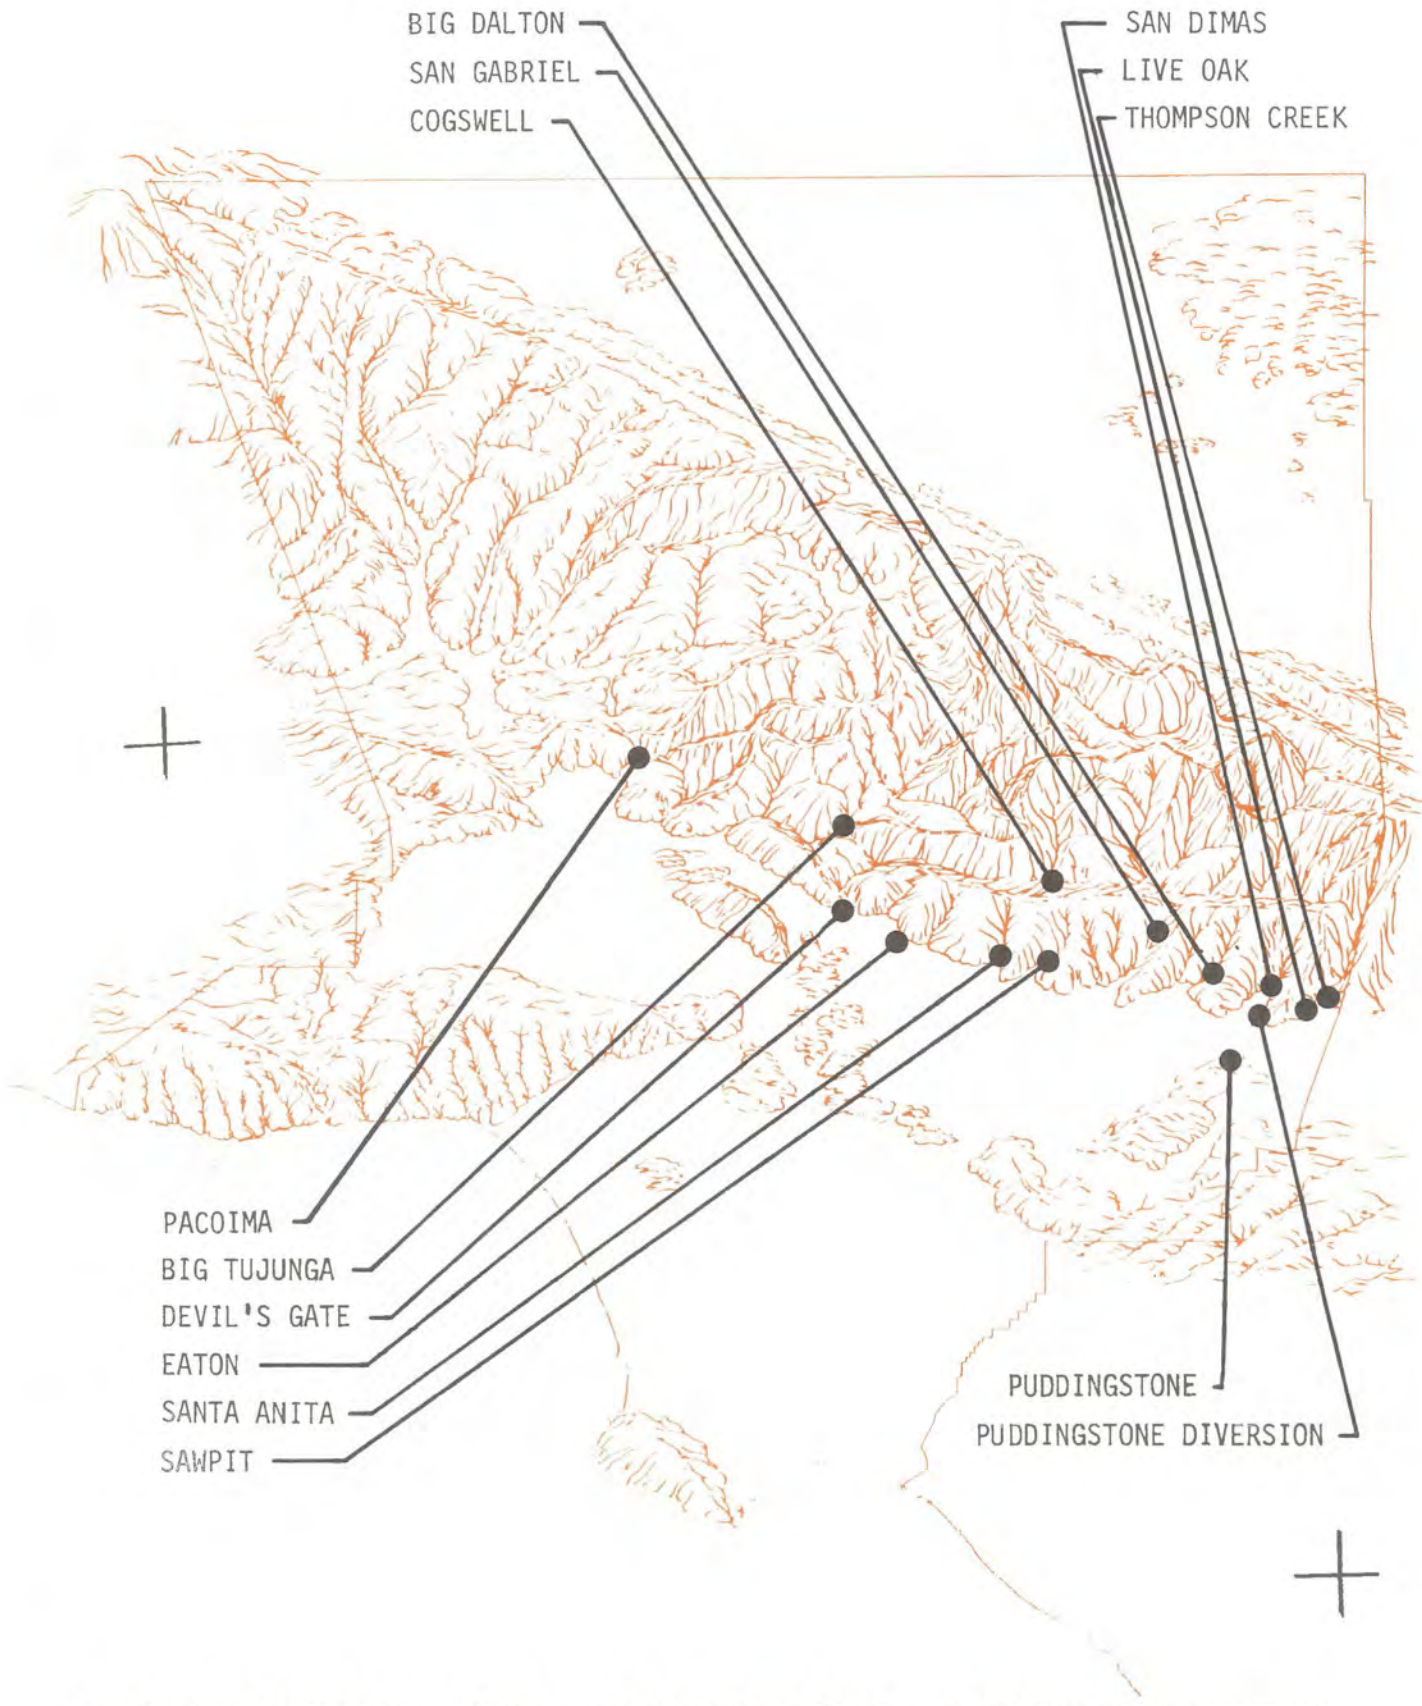
3. Inflow in cubic feet per second is usually calculated from storage change and known outflow. When outflow is not known, the inflow may be determined from gaging station records or interpolated between measurements.

4. Outflow in cubic feet per second is mean daily valve and/or spillway discharge. These values are determined from gaging station records, known valve openings and rating curves, or from storage change and known inflow.

5. In some instances, total monthly and yearly evaporation and percolation losses have been computed and are indicated on the Dam Operation Records. Discrepancies between outflow and storage losses at certain dams are attributable to percolation and/or evaporation losses and are shown as total monthly and yearly losses. Total monthly evaporation losses are shown as determined from measurements made on floating or land evaporation pans. In those cases where no allowances were made for evaporation, the amounts are necessarily included in the flow values.

   Accuracy of the flow records computed from storage records is dependent on the frequency with which storage data are revised to keep in step with physical change in reservoirs.

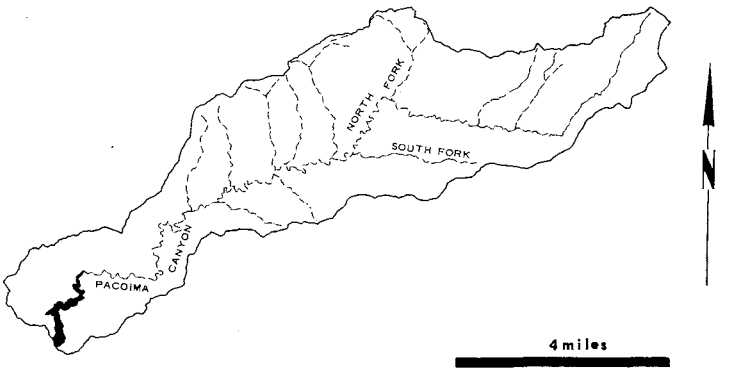
   Recovery of storage capacity lost through sedimentation is accomplished through sluicing and excavation.



LOCATION OF DISTRICT RESERVOIRS

PACOIMA DAM
AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started March 1925 - Completed February 1929

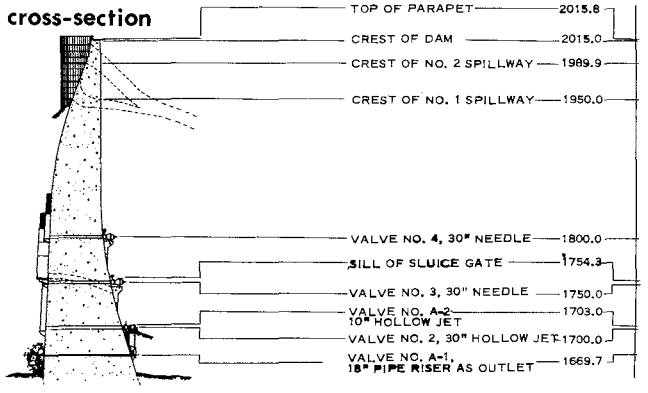
LOCATION -
Pacoima Canyon, 4.0 miles northeast of San Fernando

DRAINAGE AREA - 28.2 square miles

CAPACITY - 3,929 acre-feet

SPILLWAY ELEVATION - 1,950.0 feet

cross-section



PACOIMA DAM

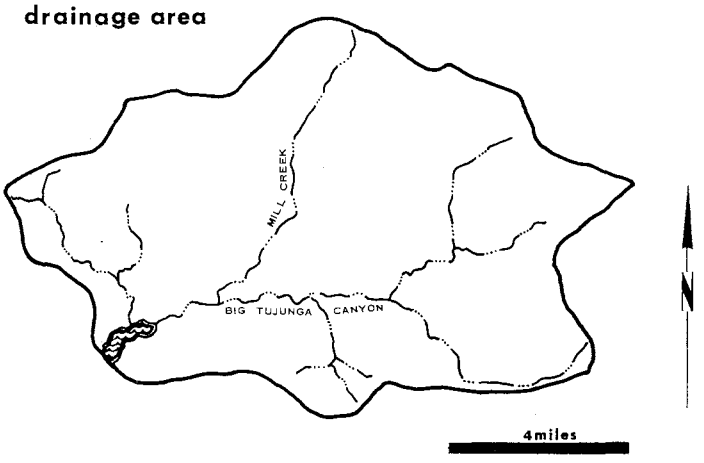
REMARKS: *Outflow station submerged during this period
() Indicates evaporation

BIG TUJUNGA DAM AND RESERVOIR



PURPOSE -
Flood Control and Conservation

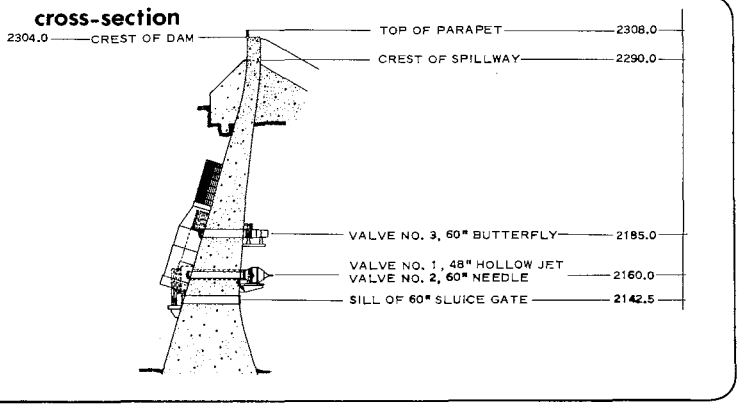
DATE CONSTRUCTED -
Started January 1930 - Completed July 1931

LOCATION -
Big Tujunga Canyon, 10.0 miles northeast of Sunland

DRAINAGE AREA - 82.3 square miles

CAPACITY - 6,027 acre-feet

SPILLWAY ELEVATION - 2,290.0 feet



BIG TUJUNGA DAM

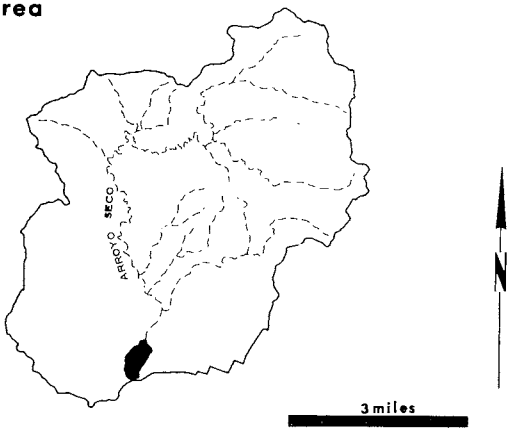
DEVIL'S GATE DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started May 1919 - completed June 1920

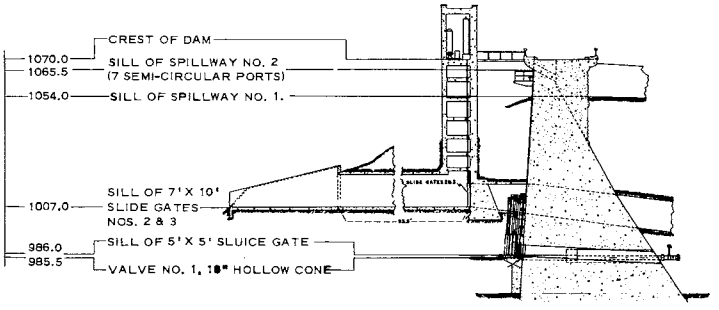
LOCATION -
On Arroyo Seco, northwest of Pasadena

DRAINAGE AREA - 31.9 square miles

CAPACITY - 1,928 acre-feet

SPILLWAY ELEVATION - 1,054.0 feet

cross-section



DEVILS GATE DAM

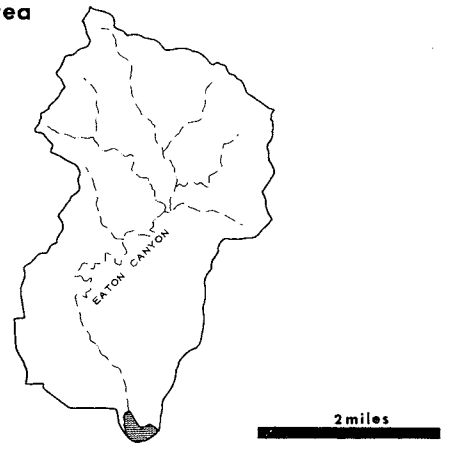
REMARKS: ( ) Indicates percolation losses
* Storage table 17 was used to compute the 1972-73 water-year as it more accurately represented the reservoir capacity.

EATON WASH DAM AND RESERVOIR

drainage area



PURPOSE -
Debris Storage and Conservation

DATE CONSTRUCTED -
Started January 1936 - Completed February 1937

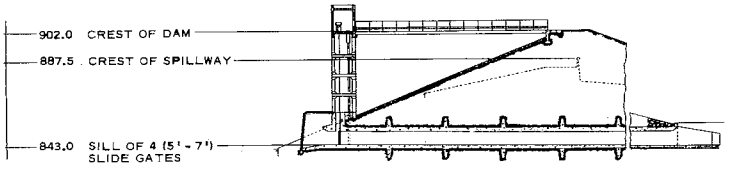
LOCATION -
Eaton Wash, northeast of Pasadena

DRAINAGE AREA - 12.4 square miles

CAPACITY - 879 acre-feet

SPILLWAY ELEVATION - 887.5 feet

cross-section



EATON DAM

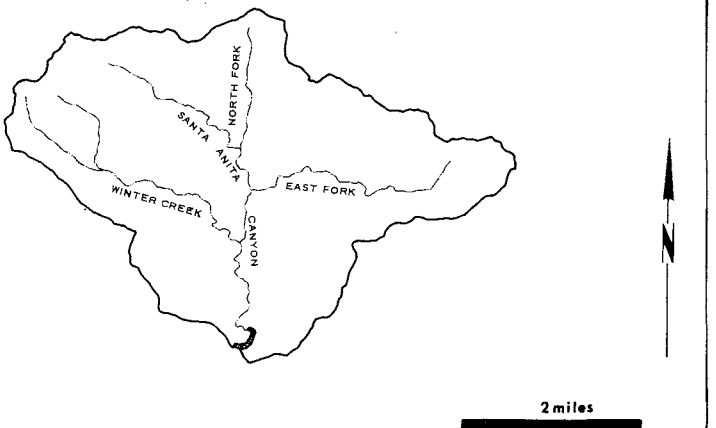
SANTA ANITA DAM
AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started October 1924 - Completed March 1927

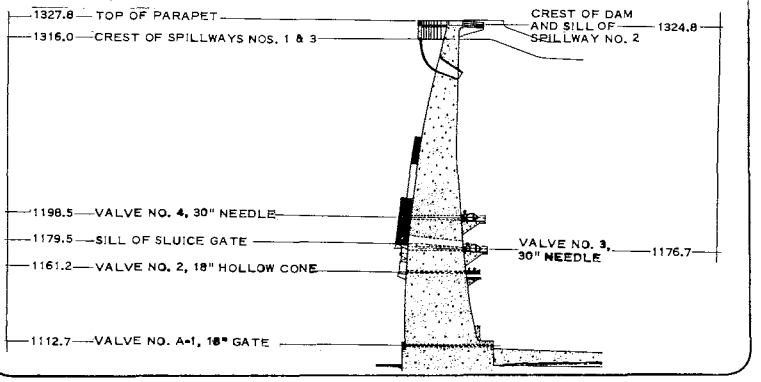
LOCATION - 2.5 miles north of Arcadia

DRAINAGE AREA - 10.8 square miles

CAPACITY - 836 acre-feet

SPILLWAY ELEVATION - 1,316.0 feet

cross-section



SANTA ANITA DAM

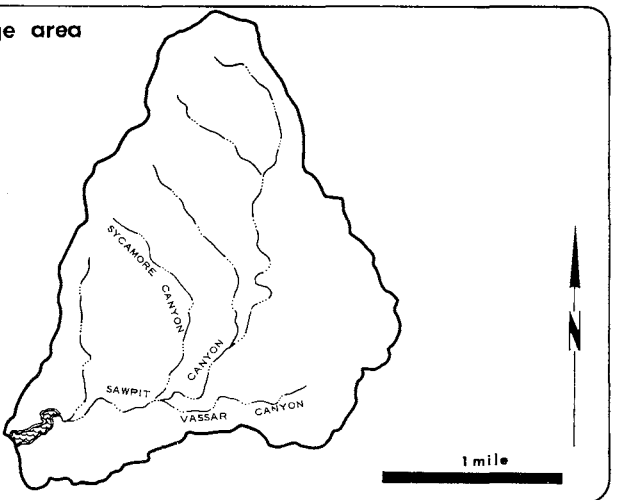
REMARKS: ( ) Indicates evaporation losses.
[ ] Indicates average for period.

SAWPIT DAM AND RESERVOIR



PURPOSE -
Flood Control and Conservation

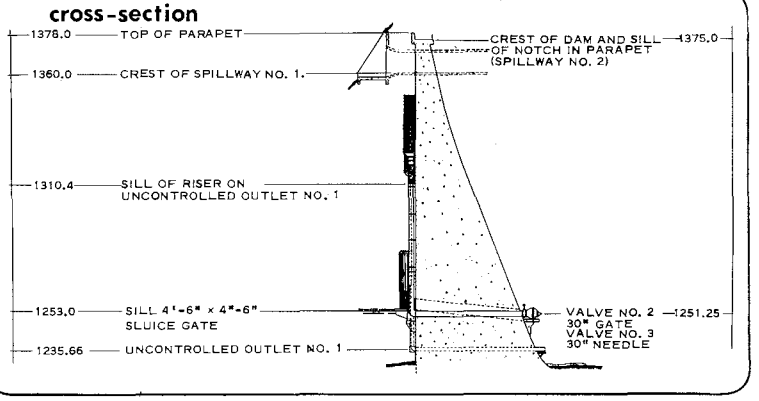
DATE CONSTRUCTED -
Started March 1926 - Completed June 1927

LOCATION - 2.0 miles north of Monrovia

DRAINAGE AREA - 3.2 square miles

CAPACITY - 391 acre-feet

SPILLWAY ELEVATION - 1,360.0 feet



SAWPIT DAM

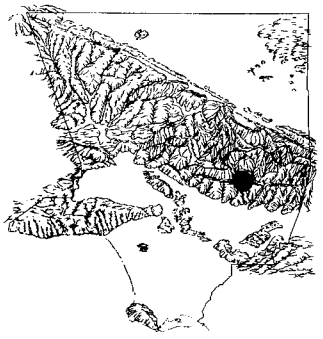
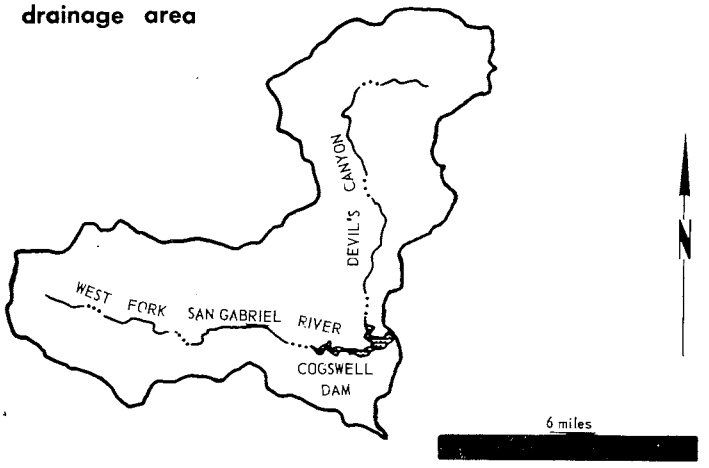
REMARKS:

COGSWELL DAM
AND RESERVOIR



drainage area



PURPOSE -
Flood Control, Conservation, and Recreation

DATE CONSTRUCTED -
Started March 1932 - Completed April 1934

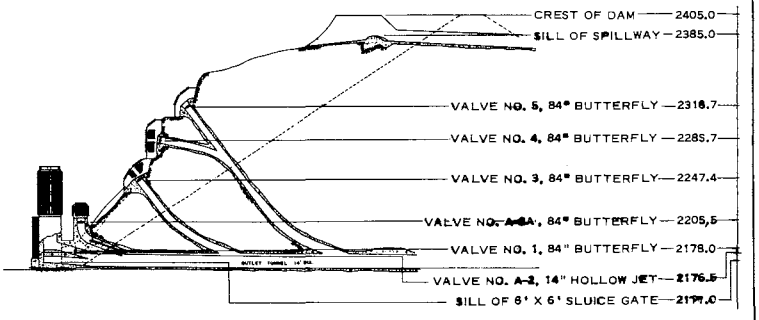
LOCATION - 22.0 miles north of Azusa

DRAINAGE AREA - 39.2 square miles

CAPACITY - 9,339 acre-feet

SPILLWAY ELEVATION - 2,385.0 feet

cross-section



COGSWELL DAM

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

DAM OPERATION RECORD

COGSWELL DAM

1972-73

DRAINAGE AREA 39.2 SQ. MI.
CAPACITY OF RESERVOIR 9318 AC. FT.,
at SPILLWAY ELEVATION 2386.0 FT.,
as of September, 19 73

GAGE HEIGHTS AND STORAGES ARE AS OF MIDNIGHT ON DAY SHOWN.

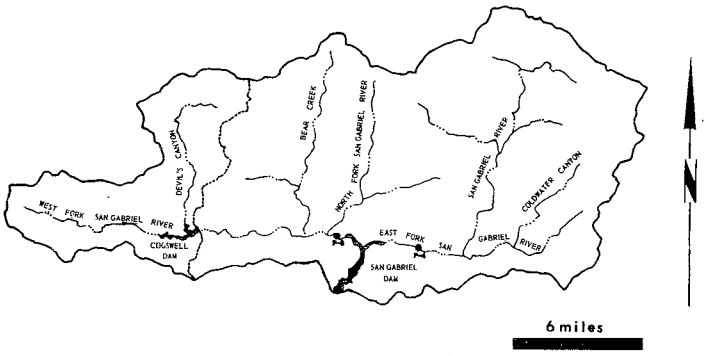
REMARKS: [Indicates average for period.
(Indicates evaporation and siltation losses.
* Includes an estimated 31.5 acre-feet loss due to siltation. An additional 61.4 acre-feet loss occurred due to siltation. Change to storage table 15, 9-1-73.

SAN GABRIEL DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started December 1932 - Completed July 1939

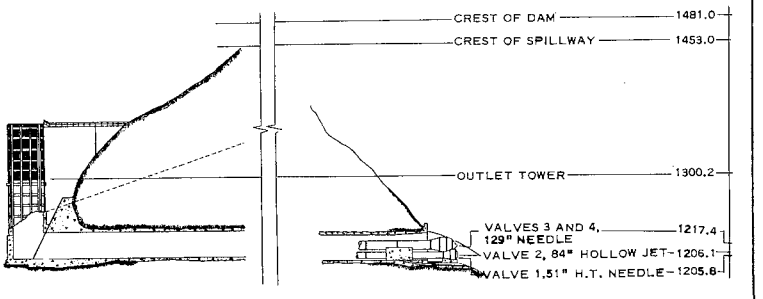
LOCATION -
San Gabriel Canyon, 7.5 miles north of Azusa

DRAINAGE AREA - 163.5 square miles (uncontrolled)
39.2 square miles (controlled)
Total 202.7 square miles
(includes Cogswell drainage)

CAPACITY - 41,549 acre-feet

SPILLWAY ELEVATION - 1,453 feet

cross-section



SAN GABRIEL DAM

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT

DAM OPERATION RECORD

San Gabriel Dam

1972-73

GAGE HEIGHTS AND STORAGES ARE AS OF MIDNIGHT ON DAY SHOWN.

DRAINAGE AREA 202.7 SQ. MI.
CAPACITY OF RESERVOIR 43800 AC. FT.,
at SPILLWAY ELEVATION 1453 FT.,
as of February, 19 73.
Spillway capacity estimated due to clean-out operations

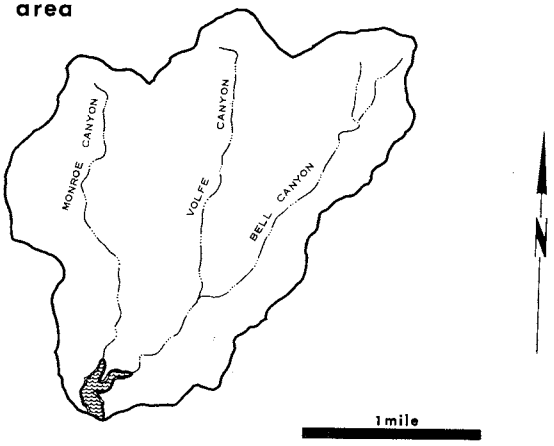
REMARKS: ( ) indicates evaporation and other losses
* Includes loss of 94.0 acre-feet due to bank storage and percolation
8.9 acre-feet gain due to change of storage tables on February 10th.

BIG DALTON DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started December 1927 - Completed August 1929

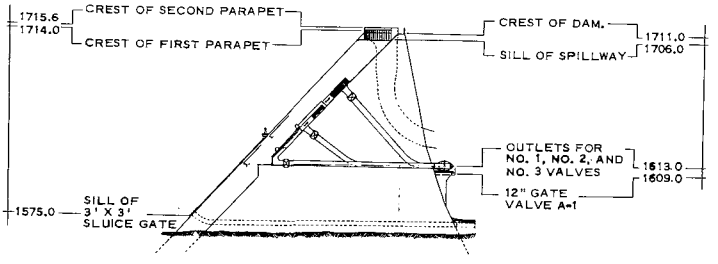
LOCATION -
Big Dalton Canyon, 4.0 miles northeast of Glendora

DRAINAGE AREA - 4.5 square miles

CAPACITY - 963 acre-feet

SPILLWAY ELEVATION - 1,706.0 feet

cross-section



BIG DALTON DAM

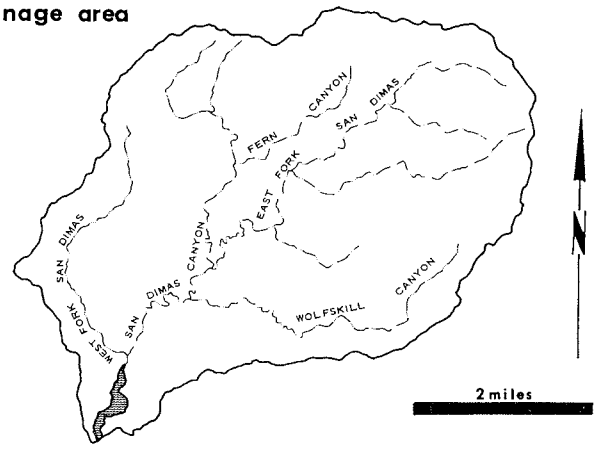
SAN DIMAS DAM
AND RESERVOIR

drainage area



PURPOSE - Flood Control and Conservation

DATE CONSTRUCTED -
Started November 1920 - Completed September 1922

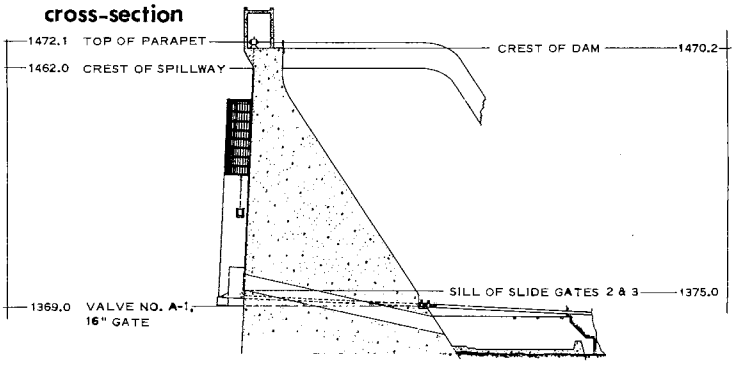
LOCATION – 3.0 miles northeast of San Dimas

DRAINAGE AREA - 16.2 square miles

CAPACITY - 1,515 acre-feet

SPILLWAY ELEVATION - 1,462.0 feet

cross-section



SAN DIMAS DAM

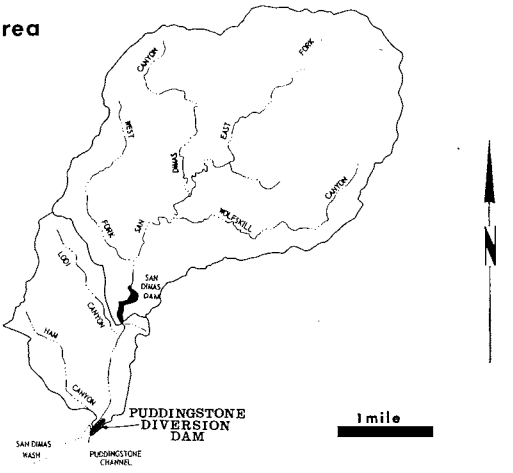
[ ] Indicates average for period.

PUDDINGSTONE DIVERSION DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Diversion of flow and Conservation

DATE CONSTRUCTED -
Started September 1927 - Completed July 1928

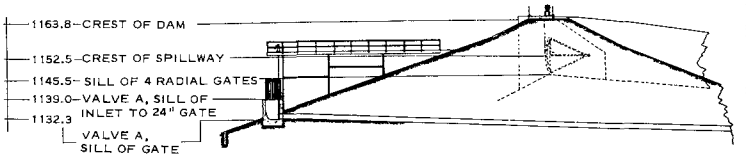
LOCATION - 2.0 miles northeast of San Dimas

DRAINAGE AREA - 3.7 square miles (uncontrolled)
16.2 square miles (controlled)
Total 19.9 square miles

CAPACITY - 148 acre-feet

SPILLWAY ELEVATION - 1,152.0 feet

cross-section



PUDDINGSTONE DIVERSION DAM

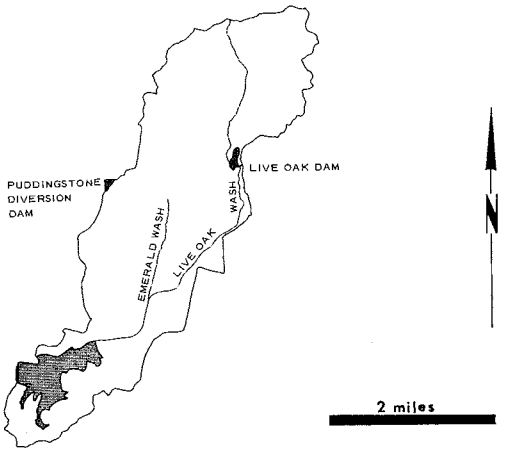
REMARKS: ( ) Indicates Percolation Losses

New Storage Table #19 used beginning July 1.

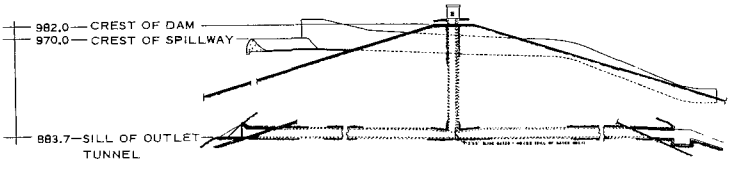
3.3 acre feet loss due to silitation

PUDDINGSTONE DAM AND RESERVOIR

drainage area



cross-section



PURPOSE - Flood Control and Recreation

DATE CONSTRUCTED -
Started February 1925 - Completed January 1928

LOCATION - 1.0 mile south of San Dimas

DRAINAGE AREA - 11.0 square miles (uncontrolled)
22.1 square miles (controlled)
Total 33.1 square miles

CAPACITY - 16,856 acre-feet

SPILLWAY ELEVATION - 970.0 feet

PUDDINGSTONE DAM

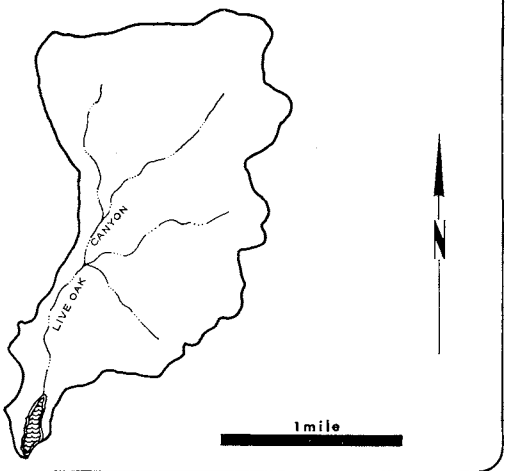
LIVE OAK DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started August 1921 - Completed November 1922

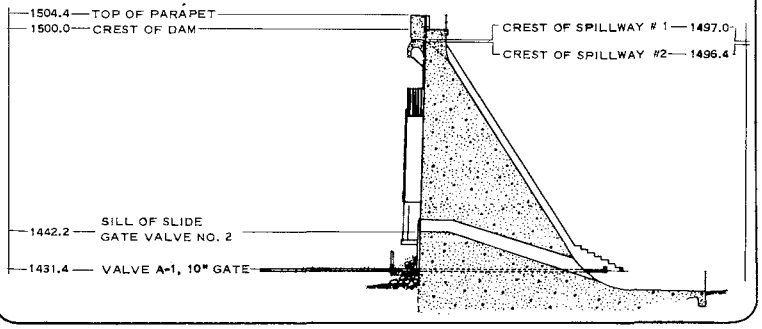
LOCATION - 2.5 miles northeast of La Verne

DRAINAGE AREA - 2.3 square miles

CAPACITY - 240 acre-feet

SPILLWAY ELEVATION - 1,496.0 feet

cross-section



LIVE OAK DAM

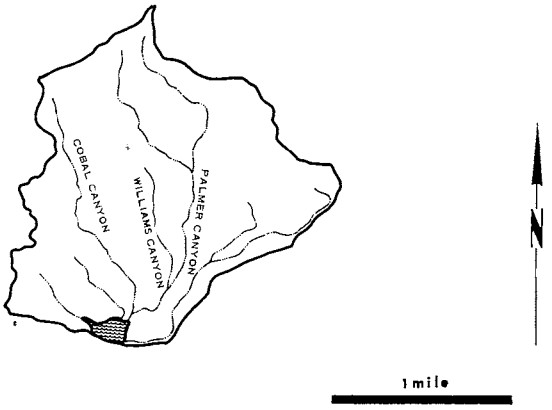
THOMPSON CREEK DAM AND RESERVOIR

drainage area



PURPOSE -
Flood Control and Conservation

DATE CONSTRUCTED -
Started September 1925 - Completed March 1928

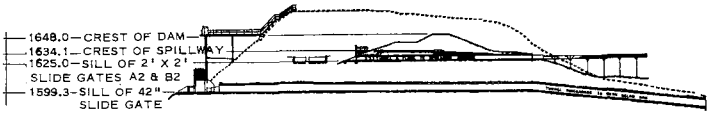
LOCATION - 3.0 miles north of claremont

DRAINAGE AREA - 3.5 square miles

CAPACITY - 447.5 acre-feet

SPILLWAY ELEVATION – 1,634.1 feet

cross-section



THOMPSON CREEK DAM

EROSION CONTROL

FOREWORD

Each year eroded material in various forms (trees, rock, sand, etc.) flows out of the mountain watersheds of Los Angeles County. If allowed to pass into downstream District facilities normal operation would, at least, be hampered and at worst, become inoperative. In an effort to control these potentially disruptive forces, the District maintains a series of debris basins in canyon mouths and upstream stabilization structures in selected watersheds.

PURPOSE

The purpose of a debris basin is to entrap the debris flows emanating from the canyons and let the relatively desilted water pass into flood control channels for transportation to major watercourses. In the 1972-73 water year, 82 debris basins were in operation, of which the District operated and maintained 81 and the Corp of Engineers operated and maintained 1, Haines Debris Basin. This figure represents an increase of 2 debris basins over the previous year. Gordon and Mull Debris Basins were added to the list of District facilities in June 1973. The maximum capacity of all 82 debris basins is 8,411,000 cubic yards of which 7,648,000 cubic yards were available at the beginning of the water year.

STABILIZATION STRUCTURES

Stabilization structures are constructed to control erosion in natural canyons. They serve to prevent downcutting by stabilizing alluvium deposits. In addition, they store debris generated by the watershed and serve to stabilize side banks reducing side slope sloughing and bank erosion.

The District maintains 218 stabilization structures in 47 watersheds. During fiscal year 1972-73, the structures were complete in Haines Canyon above Tujunga and in El Priete Canyon above Pasadena.

FOREWORD

Information presented in this Section includes amounts of local, imported, and reclaimed water conserved in spreading grounds, spreading basins, reservoirs, and channels, and also information on the sea-water barrier projects which prevent saltwater intrusion in the coastal area and on the District's water quality monitoring programs of surface and ground water. Pertinent data are presented regarding the locations and descriptions of District conservation facilities, as well as facilities owned by others. Also, included are ground-water maps delineating elevations recorded during the report period, hydrographs of selected key wells, and maps indicating the District's water quality monitoring programs.

The various types of water conserved - namely, local, imported, and reclaimed, are construed to have the following meaning in this Section: Local water is that derived from run-off due to rainfall on the mountain and valley watersheds within or tributrary to the District. Imported water is obtained from sources outside the District and not tributary to the District. Reclaimed water is the effluent produced by Whittier Narrows Water Reclamation Plant and the San Jose Creek Water Renovation Plant, both operated by the Los Angeles County Sanitation Districts.

The rainfall during the water year 1972-73 was approximately 115 per cent of normal, and the local water conserved during this period was 195,724 acre-feet. This is the third largest spreading year the District has experienced since the construction of our conservation facilities.

SPREADING GROUNDS

The total gross acreage of spreading grounds owned and operated by the District during this annual report period amounted to 2,235 acres. The District also assisted in the operation and maintenance of 679 acres of spreading grounds owned by others. An additional 246 acres of spreading grounds are controlled, maintained, and operated by other agencies. The total gross acreage of spreading grounds in the County is 3,160 acres with a combined infiltration capacity of more than 2,350 cfs.

During the report period, the District continued its cooperation with the City of Pasadena Master Planning Committee in activities aimed toward the ultimate development of Arroyo Seco Spreading Grounds and Devil's Gate Reservoir.

On June 26, 1973, the contract was awarded for construction of the intake and diversion facilities at Forbes Spreading Basin. Construction was started in August 1973 and is expected to be finished in the 1973-74 water year. Award of the contract for the second phase of construction is expected to be during the 1973-74 water year.

IMPORTED WATER

During this annual period, imported Colorado River water for spreading was obtained from The Metropolitan Water District. This water was purchased with funds provided by the Central and West Basin Water Replenishment District and the Upper San Gabriel Valley Municipal Water District.

Prior to its termination June 30, 1972, funds were also provided by the Water Conservation Zone I. The zone was established by the Board of Supervisors in January 1952 to finance the acquisition and conservation of untreated Colorado River water in the Coastal Plain. The funds were provided by taxation at a rate of $0.05 per $100 assessed value. The zone had a life of five years with provisions for renewal by the Board of Supervisors. Zone I was renewed three times before its termination in 1972.

Imported water for the Coastal Plain, purchased with funds from the Central and West Basin Water Replenishment District, was spread in the District's facilities in the Rio Hondo and San Gabriel River systems south of Whittier Narrows Dam.

Imported water for the San Gabriel Valley Groundwater Basin, purchased by the Upper San Gabriel Valley Municipal Water District, was spread in Santa Fe Spreading Grounds and in the San Gabriel River between Morris Dam and the spreading grounds.

RECLAIMED WATER

The County Sanitation Districts ' Whittier Narrows Water Reclamation Plant, in operation since 1962, produced from 12 to 18 mgd of high quality effluent during the annual period. The effluent is purchased by the Central and West Basin Water Replenishment District and transported to the Rio Hondo and San Gabriel River systems for ground-water replenishment.

The County Sanitation Districts' San Jose Creek Water Renovation Plant, activated in May 1972, made its first delivery of effluent in November of 1972. This effluent is also purchased by the Central and West Basin Water Replenishment District and is transported by pipeline to the San Gabriel River system for ground-water replenishment.

Reclaimed water comprised about 22 per cent of the total purchased water spread in the Montebello Forebay between October 1, 1972 and September 30, 1973.

BARRIER PROJECTS

The West Coast Basin Barrier Project, just inland of the Santa Monica Bay coastline, prevents the intrusion of ocean water into the freshwater aquifers by the injection of filtered Colorado River water to form a pressure barrier. While the project is essentially completed within its approximate nine mile reach covering the coastline from the Los Angeles International Airport to the base of the Palos Verdes Hills, plans were being formulated for the construction of ten injection wells and six observation wells to provide additional protection and monitoring capabilities. During the year, 28,100 acre-feet of fresh water was injected and injection rates throughout the year averaged 40 cfs.

The Dominguez Gap Barrier Project was designed to prevent sea-water intrusion from the San Pedro Bay into the West Coast Basin through the Dominguez Gap area. Since the initiation of injection operations at theproject in February 1971, some difficulty has been experienced in the ability to build the pressure ridge necessary to provide appropriate protection and injection rates have been limited pending further investigation. During the year, 8,500 acre-feet of fresh water was injected at an average rate of 11 cfs.

The existing operational facilities of the Alamitos Barrier Project consist of 18 injection wells and 4 extraction wells. The project facilities are designed to protect the ground water supplies of the Central Basin of Los Angeles County and the Eastern Coastal Plain Basin of Orange County from intrusion of seawater through the Alamitos Gap area. During the year, 5,200 acre-feet of fresh water was injected at an average rate of 7 cfs and 980 acre-feet of saline water was extracted at an average rate of 1.5 cfs. Evaluation of the effectivenessof the existing facilities continued during this period to determine the need for possible additional facilities and to establish a schedule for continued expenaion of the project facilities within the scope of the staged development as originally planned.

EXPLORATION AND OBSERVATION WELLS

During this annual report period, approximately 15 wells were drilled for monitoring groundwater levels and obtaining geologic data for use in planning and operating various District Water Conservation projects. These wells were drilled by the District and other cooperating agencies and preserved by the District for future use.

SEASONAL DATA AND MAPS

During this annual report period, about 26,000 ground-water observations were obtained from approximately 3,200 wells. Hydrographs for selected key wells are included in this report.

Rainfall averages over Los Angeles County was 115 per cent of the 90-year normal. As a result groundwater levels over most of the County remained nearly stable. An exception is the Antelope Valley. Records as far back as 1955 has shown a steady decline in this basin. Historic lows occurred in the Chino Basin within Los Angeles County, and in the Main San Fernando Basin north of Van Nuys. No historic highs occurred in the basins.

GROUNDWATER BASINS

The natural underground water reservoirs underlying Los Angeles County consist of groundwater basins which are grouped under five local watersheds. These waterheds are identified as San Fernando Valley, Coastal Plain, Santa Clarita Valley, and Antelope Valley.

The following paragraphs relate the differrence in ground-water level as taken from wells which were chosen as representative of average basin conditions. These differences represent the change in level from October 1 to September 30 of the following year. The hydrographs from which some of the changes in water level were taken are shown on following pages.

SAN FERNANDO VALLEY

The San Fernando Valley watershed overlies the San Fernando Main Basin, and five sub-basins. During this report period, mean ground-water levels in the Main Basin appeared to have stabilized. An exception is the Burbank and North Hollywood area where levels rose five feet. Mean water level changes in the sub-basins are: Sylmar (-6), Tujunga (+3), Verdugo (stable), Glenoaks (+30), and Pacoima (stable).

SAN GABRIEL VALLEY

The San Gabriel Valley watershed contains seventeen basins, in addition to the San Gabriel Main Basin, which is the largest basin in the Valley.

During the report period, water levels in the San Gabriel Main Basin rose about 10 feet. Other water level changes are: Raymond (+2), Monk Hill (+1), Upper San Gabriel Canyon (+65), Lower San Gabriel Canyon (+12), Glendora (Stable), Way Hill (-12), Foothill (+12), San Dimas (+3), Live Oak (-5), Lower Claremont Heights (-22), Upper Claremont (+18), Pomona (-3), Chino (-5), Spadra (Stable), and Puente (+7).

COASTAL PLAIN

Groundwater levels in most of the Central and West Coast Basin have remained stable during this report period. The exception is the Inglewood area near Hawthorne where ground-water levels rose about +9 feet and the Pico Rivera area (+31).

SANTA CLARITA VALLEY

Groundwater levels in the main portion of the basin for this period was fairly stable. Water level records as obtained from measurements in Well 7048A show the water table has maintained its present level since the 1969 storm.

ANTELOPE VALLEY

The Lancaster Basin has continued to fall during this period and is about three feet lower than the previous report period.

No groundwater maps for the Antelope Valley are drawn by the District. The maps drawn in the past were provided by the United States Geological Survey and the Department of Water Resources. None were provided for this report.

WATER QUALITY MONITORING PROGRAMS

Surface and groundwater quality programs are conducted as part of the District's water conservation responsibilities. Summer and storm season channel flows are monitored to maintain a continuing record of their quality, to find and trace pollutants to their source, to determine their effects, and to determine the acceptability of surface water for spreading to replenish the ground water supply and for discharge to the ocean of other receiving waters. Ground waters are monitored to maintain a continuing record of water quality, measure the effects of percolation of surface waters, the intrusion of seawater, and to trace groundwater quality changes from various natural and man-made sources.

SURFACE WATER QUALITY

The Surface Water Quality Program currently involves the sampling of dry weather flows at 30 locations on the Los Angeles River, San Gabriel River, Santa Clara River, Rio Hondo, Coyote Creek, Dominguez Channel, Ballona Creek, Centinela Creek, San Jose Creek, Topanga Canyon Channel, and Malibu Creek systems. These locations are sampled in the early morning on a monthly frequency on successive working days. The samples are analyzed by the Water Quality Laboratory for major minerals, mercury, total dissolved solids, total hardness, electrical conductivity, pH, dissolved oxygen, chemical oxygen demand, biochemical oxygen demand, coliform, fecal coliform, and enterococci. An annual analysis for trace metals is performed by a private laboratory.

In the Storm Water Quality Program, samples are currently taken each storm season during the major storms at 26 gaging stations and 7 spreading grounds throughout the County. The flow data is recorded at the time each sample is taken and the samples are analyzed for electrical conductivity. In addition to the annual sampling, every five years since 1957-58 a comprehensive sampling analyses of major storm flows has been performed at many locations throughout the County. The samples are analyzed by the

Water Quality Laboratory for major minerals, total dissolved solids, electrical conductivity, suspended solids, pH, dissolved oxygen, biochemical oxygen demand, coliform, fecal coliform, enterococci, pesticides, and herbicides. In order to acquire data on trace metals in storm flows, a special monitoring program will be conducted in 1973-74.

SURFACE WATER QUALITY DATA

Data acquired as part of these programs is on file in the Water Quality Section. With the exception of TDS and bacteria, all data has been processed by the Department of Water Resources and is available on computer generated listings. Utilization of STORET, an Environmental Protection Agency computer system to store, retrieve, and manipulate data, is in the development stages.

GROUND WATER QUALITY

The annual sampling of water wells in five major basins in Los Angeles County comprises the Ground-Water Quality Program. The monitoring program, initiated in 1970, is coordinated with the State of California Department of Water Resources and City of Los Angeles - Department of Water and Power with these agencies participating in the sampling and analysis of a portion of the total samples.

All water wells sampled are active production wells used for municipal supply, irrigation, and industrial purposes and are selected to present overall portrayal of quality conditions. The samples are analyzed for major minerals, total dissolved solids, electrical conductivity, pH, and in some cases phosphate, fluoride, or boron concentrations.

GROUND WATER QUALITY DATA

Data acquired as part of these programs is on file in the Water Quality Section and has been computer processed by the Department of Water Resources.

DOMINGUEZ GAP	DEEP BASIN	1957-58	54	26	-	20	237	3	CONTINUES 1.0 MILE SOUTH FROM DEL AMO BOULEVARD, AND BORDERS THE EASTERN AND WESTERN SIDES OF THE LOS ANGELES RIVER.	CONTROLLED FLOW FROM LOS ANGELES RIVER LOW FLOW CHANNEL AND UNCONTROLLED FLOWS FROM STORM DRAINS.	EAST SIDE BASIN USED FOR FLOOD REGULATION WITH SOME CONSERVATION STORAGE. INTAKE OF 20 CFS IS THE FIGURE FOR LOW FLOW DIVERSION FROM THE LOS ANGELES RIVER. THE WEST SIDE BASIN IS FED BY A 42-INCH CONCRETE PIPE FROM THE EAST SIDE BASIN.
WALTERIA SPREADING BASIN	DEEP BASIN	1962-63	26	-	-	-	85	6	WEST SIDE OF HAWTHORNE AVENUE AT 236TH STREET.	LOCAL STORM DRAINS.	BASIN USED FOR FLOOD REGULATIONS WITH SOME CONSERVATION STORAGE.
TOTALS			2,235	1,512		10,310		1,511			

*THE CAPACITIES LISTED ARE BASED ON INFILTRATION RATES WHICH MAY BE EXPECTED TO PERSIST FOR AT LEAST FIVE DAYS BUT ARE NOT VALID FOR SUSTAINED SPREADING OPERATIONS.

**DESIGN CAPACITY OF MAIN CONCRETE CHANNEL.

***DOES NOT INCLUDE AREA DOWNSTREAM FROM SANTA FE DAM SPILLWAY WHICH IS BEING TESTED TO DETERMINE AREA NECESSARY TO COMPENSATE FOR CAPACITY LOSS DUE TO FREEWAY CONSTRUCTED ACROSS THE SPREADING GROUNDS PROPER.

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT
WATER CONSERVATION DIVISION
SUMMARY OF DATA ON SPREADING FACILITIES
NOT OWNED BY THE DISTRICT
UPDATED THROUGH SEPTEMBER 1973

GROUNDS	TYPE	SEASON FIRST USED	AREA IN ACRES		CAPACITIES				LOCATION	SOURCE OF WATER	REMARKS
			GROSS	WETTED	CHANNEL** CFS	INTAKE CFS	STORAGE A.F.	PERC.* CFS			
GROUNDS IN WHICH DISTRICT DOES CONSTRUCTION, MAINTENANCE, AND SOME OPERATIONS:											
SIERRA MADRE	SHALLOW BASINS	ABOUT 1933	22	9	-	25	47	18	CITY OF SIERRA MADRE, SOUTH SIDE OF GRANDVIEW AVENUE, ONE HALF MILE WEST OF SANTA ANITA AVENUE.	LITTLE SANTA ANITA CREEK AND STREET RUNOFF ONLY PRIOR TO 1951-52. STARTING IN 1951-52 ALSO CONTROLLED FLOWS FROM SANTA ANITA DAM.	NO RECORDS OF WATER SPREAD PRIOR TO 1951-52. GROUNDS REBUILT IN 1951. ULTIMATE CAPACITY ESTIMATED 25 CFS. THREE BASINS ADDED IN SUMMER OF 1959.
FISH CREEK	SHALLOW BASINS	ABOUT 1917	6±	4	-	-	-	7	WESTERLY SIDE OF SAN GABRIEL RIVER BELOW MOUTH OF FISH CANYON AND NORTH OF THE CITY OF AZUSA.	SAN GABRIEL RIVER, CONTROLLED RELEASES FROM COGSWELL DAM, SAN GABRIEL DAM, AND MORRIS DAM, VIA DUARTE DITCH.	DISTRICT DELIVERS WATER, DOES HYDROGRAPHIC WORK AND SOME CONSTRUCTION. SOME WATER ALSO PERCOLATES IN SAN GABRIEL RIVER IN VICINITY OF SPREADING GROUNDS AND IN BRUSH LAND WHERE IRRIGATION WASTE LINES DISCHARGE. NO SEPARATE RECORDS KEPT PRIOR TO 1926-27.
THOMPSON CREEK	DITCHES CHECKS AND DEEP BASIN	ABOUT 1928	53	37	-	70	-	37	SOUTHERLY FROM, AND ADJACENT TO THOMPSON CREEK DAM, EAST SIDE OF CREEK.	COBAL, WILLIAMS, PALMER, AND PADUA CREEKS, ALSO THOMPSON CREEK, WHEN RESERVOIR ABOVE ELEV. 1625.	HELD UNDER EASEMENT BY THE DISTRICT, OPERATED BY POMONA VALLEY PROTECTIVE ASSOCIATION. IN ADDITION TO THE 53 ACRES, SOME AREA WITHIN THOMPSON CREEK RESERVOIR IS USED TO SPREAD STORM FLOWS. WATER SPREAD IN AREA SINCE ABOUT 1918.
SAN ANTONIO	DITCHES CHECKS AND SHALLOW BASINS	1921-22	598	300	8,000	900	-	300	BOTH SIDES OF SAN ANTONIO CREEK. FROM TWO AND ONE HALF MILES ABOVE BASE LINE SOUTH WESTERLY TO BASE LINE.	CONTROLLED RELEASES FROM THE SAN ANTONIO FLOOD CONTROL DAM.	HELD UNDER EASEMENT BY THE DISTRICT, OPERATED BY POMONA VALLEY PROTECTIVE ASSOCIATION. WEST SIDE OF CHANNEL 500 ACRES. EAST SIDE OF CHANNEL 98 ACRES. IN ADDITION THERE ARE 207 ACRES EAST OF CHANNEL IN SAN BERNARDINO COUNTY; WATER SPREAD IN VICINITY ON AND OFF AS EARLY AS ABOUT 1896.
TOTALS			679		-	-	-	362			
GROUNDS CONTROLLED BY OTHERS. THE DISTRICT COOPERATING:											
CITY OF POMONA	DITCHES CHECKS AND SHALLOW BASINS	(SEE REMARKS)	10	8	-	-	-	-	NORTH OF CLAREMONT, ONE HALF MILE NORTH OF FOOTHILL BOULEVARD AND 1.8 MILE WEST OF MILLS AVENUE.	SAN ANTONIO CREEK WATER DELIVERED THROUGH LOOP MERSERVE CANYON WATER CO'S. PIPE LINE. ALSO SOME LOCAL RUNOFF.	WATER SPREAD IN VICINITY ON AND OFF SINCE ABOUT 1897. GROUND ACQUIRED BY CITY OF POMONA, OCTOBER 1926. NO RECORD OF WATER SPREAD PRIOR TO 1949-50. DEEP BASIN COMPLETED IN 1957.
L.A. CITY DEPT. OF WATER & POWER TUJUNGA	SHALLOW BASINS	1931-32	188	130	22,000	400	-	3[illegible]	SAN FERNANDO VALLEY, EAST SIDE OF TUJUNGA WASH AT ROSCOE BOULEVARD.	LOS ANGELES CITY'S OWENS VALLEY ACQUEDUCT AND CONTROLLED RELEASES FROM HANSEN DAM.	PRIOR TO 1938 FLOOD, USED 80 ACRES NET. TUJUNGA CHANNEL ON WESTERLY SIDE OF GROUNDS PAVED IN 1950.
HEADWORKS	SHALLOW BASINS	1938-39	48	28	57,000	-	40	40	SAN FERNANDO VALLEY, SOUTH OF LOS ANGELES RIVER, ABOVE MARIPOSA STREET.	LOS ANGELES RIVER, PARTIALLY CONTROLLED BY VARIOUS DAMS. RELEASE OF OWENS VALLEY WATER FROM CHATSWORTH RESERVOIR. GROUND WATER FROM WELLS IN THE WEST END OF SAN FERNANDO VALLEY.	CRYSTAL SPRINGS INFILTRATION AREA, NOT REGULAR SPREADING GROUNDS. WATER PUMPED OUT FROM COLLECTING GALLERIES UNDER AREA. IN OCTOBER 1958 A 130-FOOT COLLAPSIBLE RUBBER DAM WAS INSTALLED ACROSS LOS ANGELES RIVER.
TOTALS			246	165	-	-	-	-			

*THE CAPACITIES LISTED ARE BASED ON INFILTRATION RATES WHICH MAY BE EXPECTED TO PERSIST FOR AT LEAST FIVE DAYS BUT ARE NOT VALID FOR SUSTAINED SPREADING OPERATIONS.

(A) Includes Metropolitan Water District water purchased under contract with San Gabriel Valley Labor Association.

(B) San Dimas Canyon water spread prior to 1965-66 in temporary development below Puddingstone Diversion.

(C) San Dimas Spreading development inoperative after 1968 - 69 water year.

(D) San Gabriel River from Santa Fe Dam to rising water. Hook levees developed in river, 1965.

(E) San Gabriel River from Whittier Narrows Dam to Florence Avenue; (Hook levees developed in river, 1954) and the San Gabriel Coastal Spreading Grounds.

(F) Spreading grounds only up through 1968-69 water year, thereafter figures include Whittier Narrows Dam (Rio Hondo side) percolation.

(a) Differences between water distributed and water financed due to the following:

1. Water temporarily held in storage at Puddingstone Reservoir from one water year to the next.
2. Losses in Puddingstone Reservoir.
3. District records are based on 12 midnight readings, amounts shown under Financing Column are based on meter readings taken during normal working hours.

(b) Rio Hondo Spreading Grounds and Whittier Narrows Reservoir.

(c) Make-up water purchased by the Upper San Gabriel Valley Municipal Water District and spread in the lower San Gabriel System.

(d) All reclaimed water purchased by Central and West Basin Water Replenishment District.

(A) Beginning in 1958-59, this excludes canyon water spread at Ben Lomond.

(B) Operated by Pomona Valley Protective Association.

(C) Water spread, no records kept.

(D) Daily measurements made. Total volume not computed.

(E) East Side Water Committee discontinued keeping records as of 1959-60 season. The San Gabriel Spreading Corporation was dissolved in the Spring of 1965. The canyon basin spreading grounds were then operated by The Committee of Nine until November 1969, at which time the Flood Control District took over operations.

(F) Water spread, records not available.

(G) Previously to 1969-70 Fish Canyon Spreading Grounds records were incorporated into San Gabriel Canyon Spreading Grounds.

(H) The District took over operation of this facility in November 1969.

(J) Record supplied by Pomona Valley Protective Association.

COASTAL PLAIN
GROUNDWATER CONTOURS
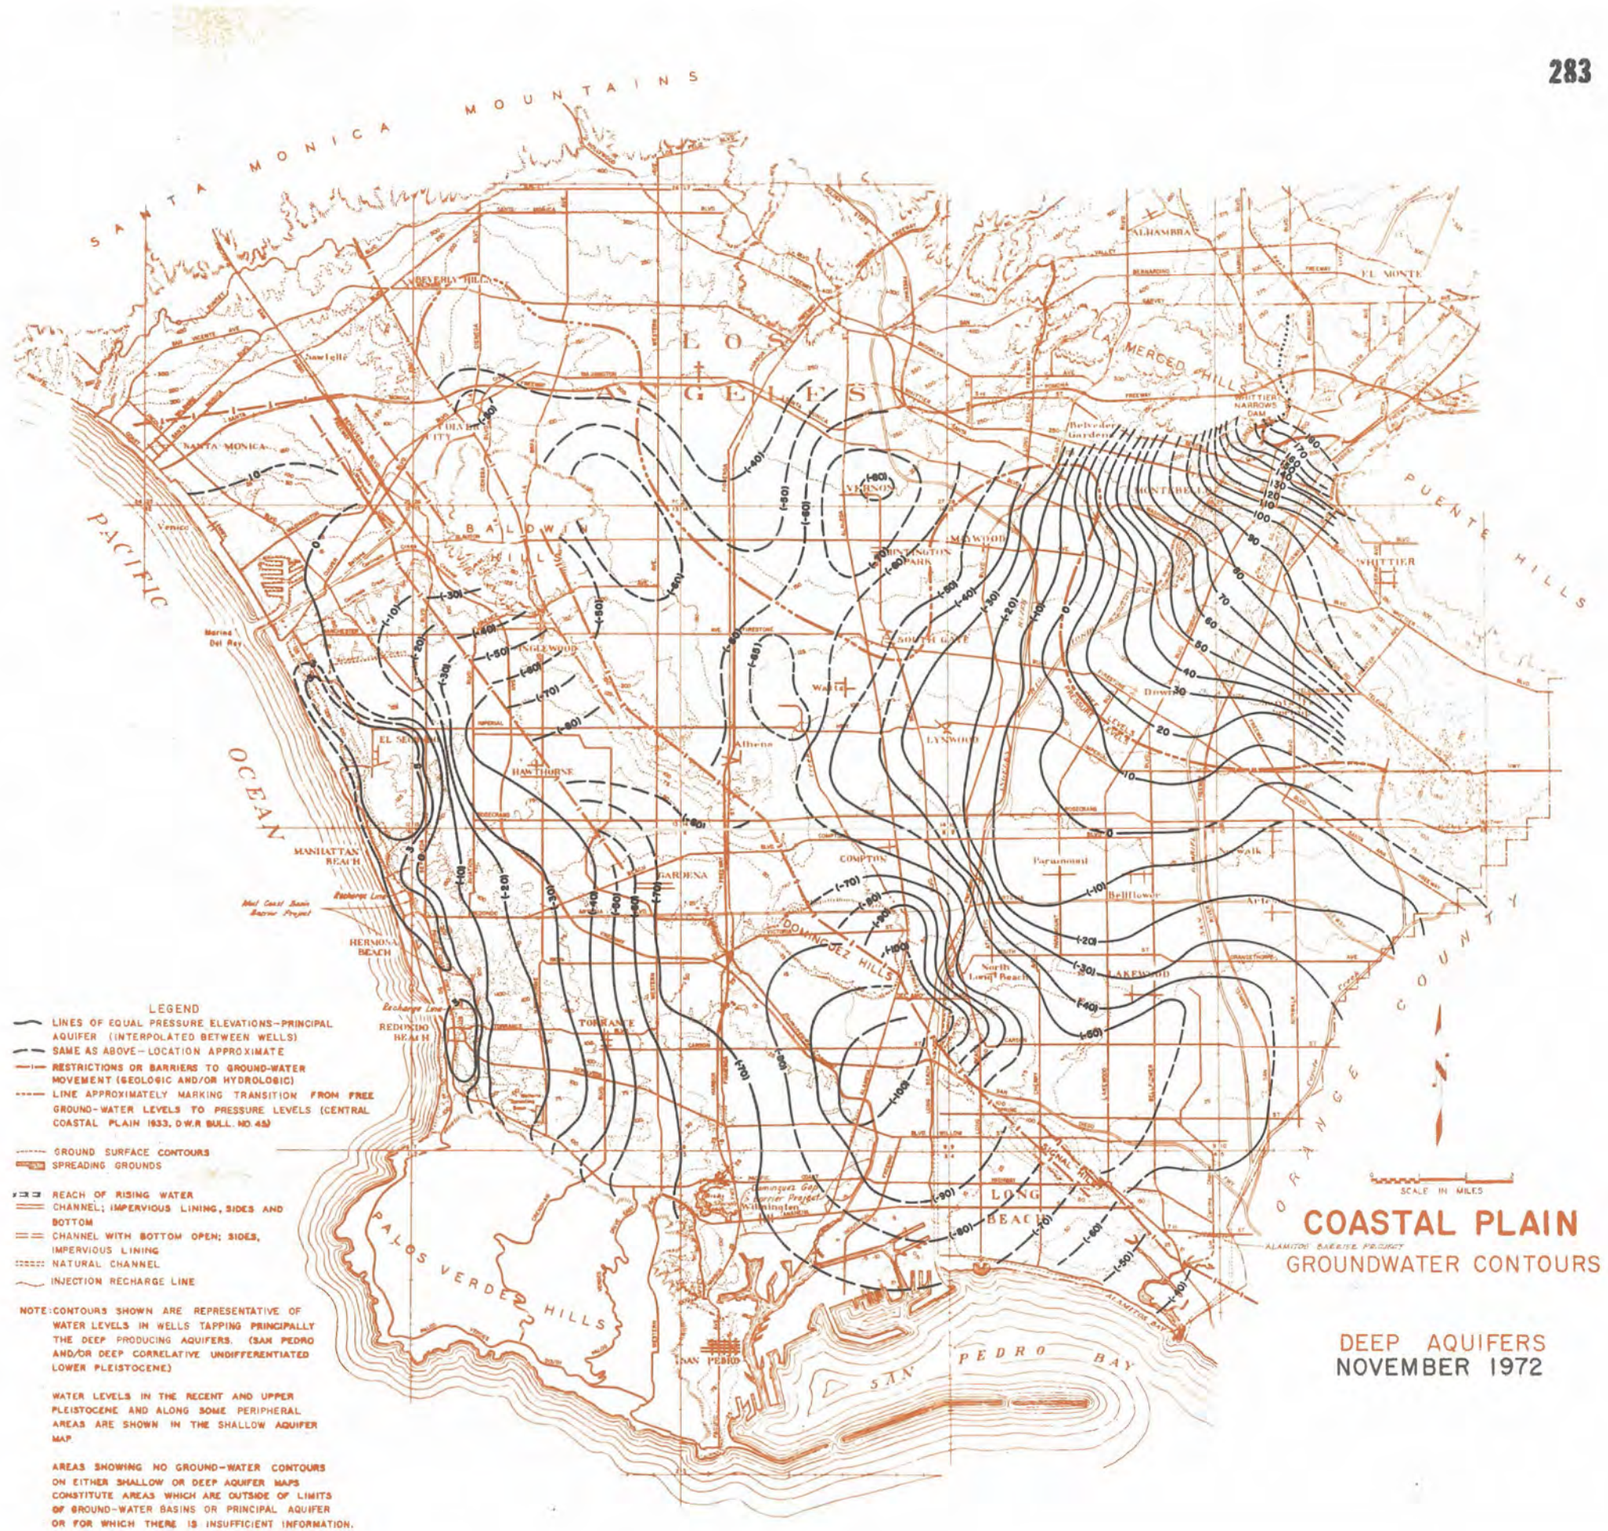
SHALLOW AQUIFERS
NOVEMBER 1972



LEGEND

- LINES OF EQUAL PRESSURE ELEVATIONS—PRINCIPAL AQUIFER (INTERPOLATED BETWEEN WELLS)
- SAME AS ABOVE—LOCATION APPROXIMATE
- RESTRICTIONS OR BARRIERS TO GROUND-WATER MOVEMENT (GEOLOGIC AND/OR HYDROLOGIC)
- LINE APPROXIMATELY MARKING TRANSITION FROM FREE GROUND-WATER LEVELS TO PRESSURE LEVELS (CENTRAL COASTAL PLAIN 1933, D.W.R BULL. NO. 45)
- GROUND SURFACE CONTOURS
- SPREADING GROUNDS
- REACH OF RISING WATER
- CHANNEL; IMPERVIOUS LINING, SIDES AND BOTTOM
- CHANNEL WITH BOTTOM OPEN; SIDES, IMPERVIOUS LINING
- NATURAL CHANNEL
- INJECTION RECHARGE LINE

NOTE: CONTOURS SHOWN ARE REPRESENTATIVE OF WATER LEVELS IN WELLS TAPPING PRINCIPALLY THE DEEP PRODUCING AQUIFERS. (SAN PEDRO AND/OR DEEP CORRELATIVE UNDIFFERENTIATED LOWER PLEISTOCENE)

WATER LEVELS IN THE RECENT AND UPPER PLEISTOCENE AND ALONG SOME PERIPHERAL AREAS ARE SHOWN IN THE SHALLOW AQUIFER MAP.

AREAS SHOWING NO GROUND-WATER CONTOURS ON EITHER SHALLOW OR DEEP AQUIFER MAPS CONSTITUTE AREAS WHICH ARE OUTSIDE OF LIMITS OF GROUND-WATER BASINS OR PRINCIPAL AQUIFER OR FOR WHICH THERE IS INSUFFICIENT INFORMATION.
